#### Lecture 24:

# Image Processing

Computer Graphics and Imaging UC Berkeley CS184/284A

Credit: Kayvon Fatahalian created the majority of these lecture slides

## Case Study: JPEG Compression

### JPEG Compression: The Big Ideas

Low-frequency content is predominant in images of the real world

The human visual system is:

- Less sensitive to detail in chromaticity than in luminance
- Less sensitive to high frequency sources of error

Therefore, image compression of natural images can:

 Reduce perceived error by localizing error into high frequencies, and in chromaticity

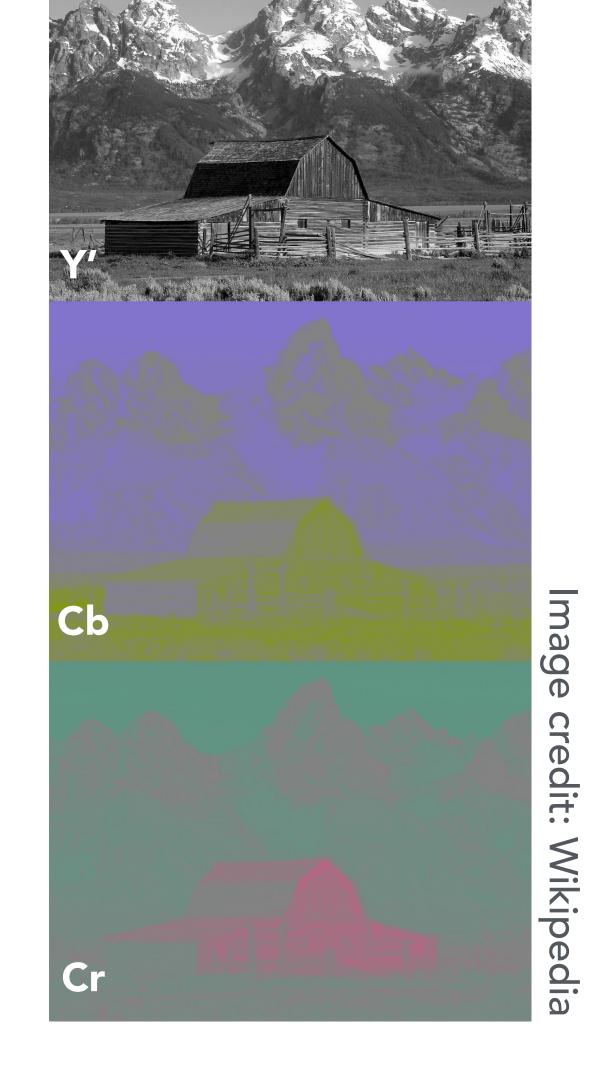

Slide credit: Pat Hanrahan

### Y'CbCr Color Space

#### Y'CbCr color space

- This is a perceptuallymotivated color space akin to L\*a\*b\* that we discussed in the color lecture
- Y' is luma (lightness), Cb and Cr are chroma channels (blue-yellow and red-green difference from gray)

\*Omitting discussion of nonlinear gamma encoding in Y' channel

CS184/284A Ren Ng

### Example Image

Original picture

### Y' Only (Luma)

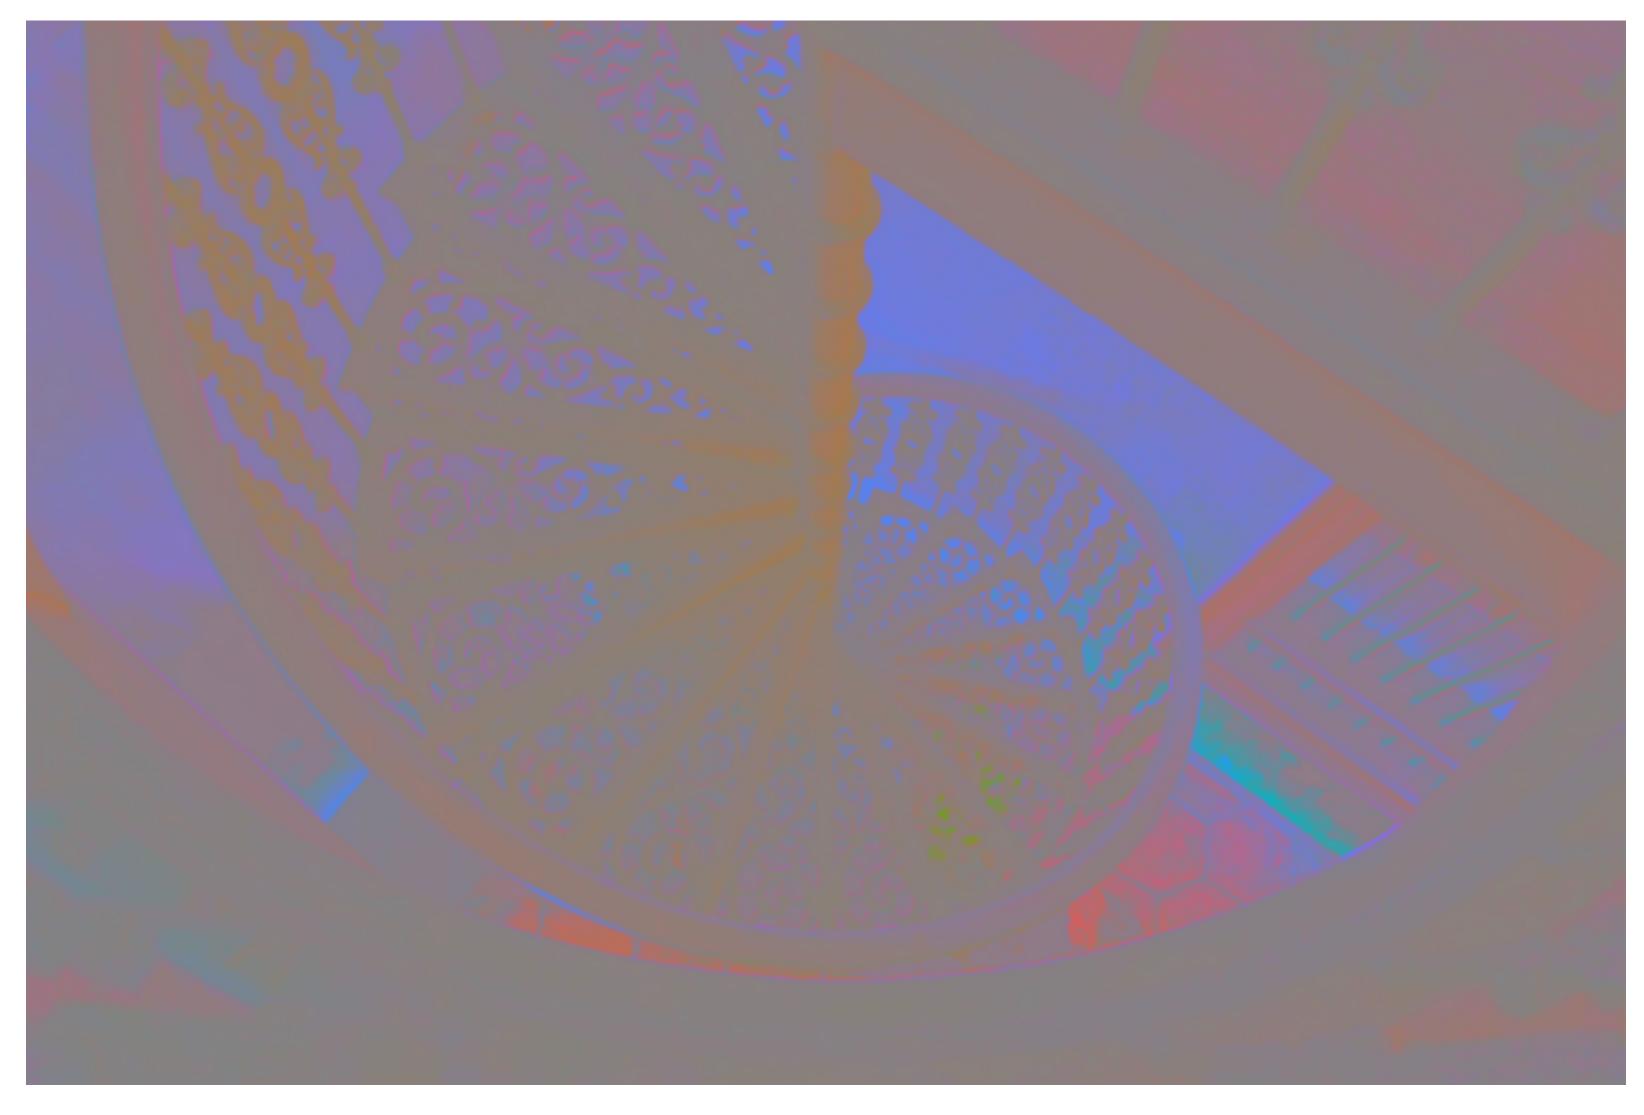

Luma channel

## Downsampled Y'

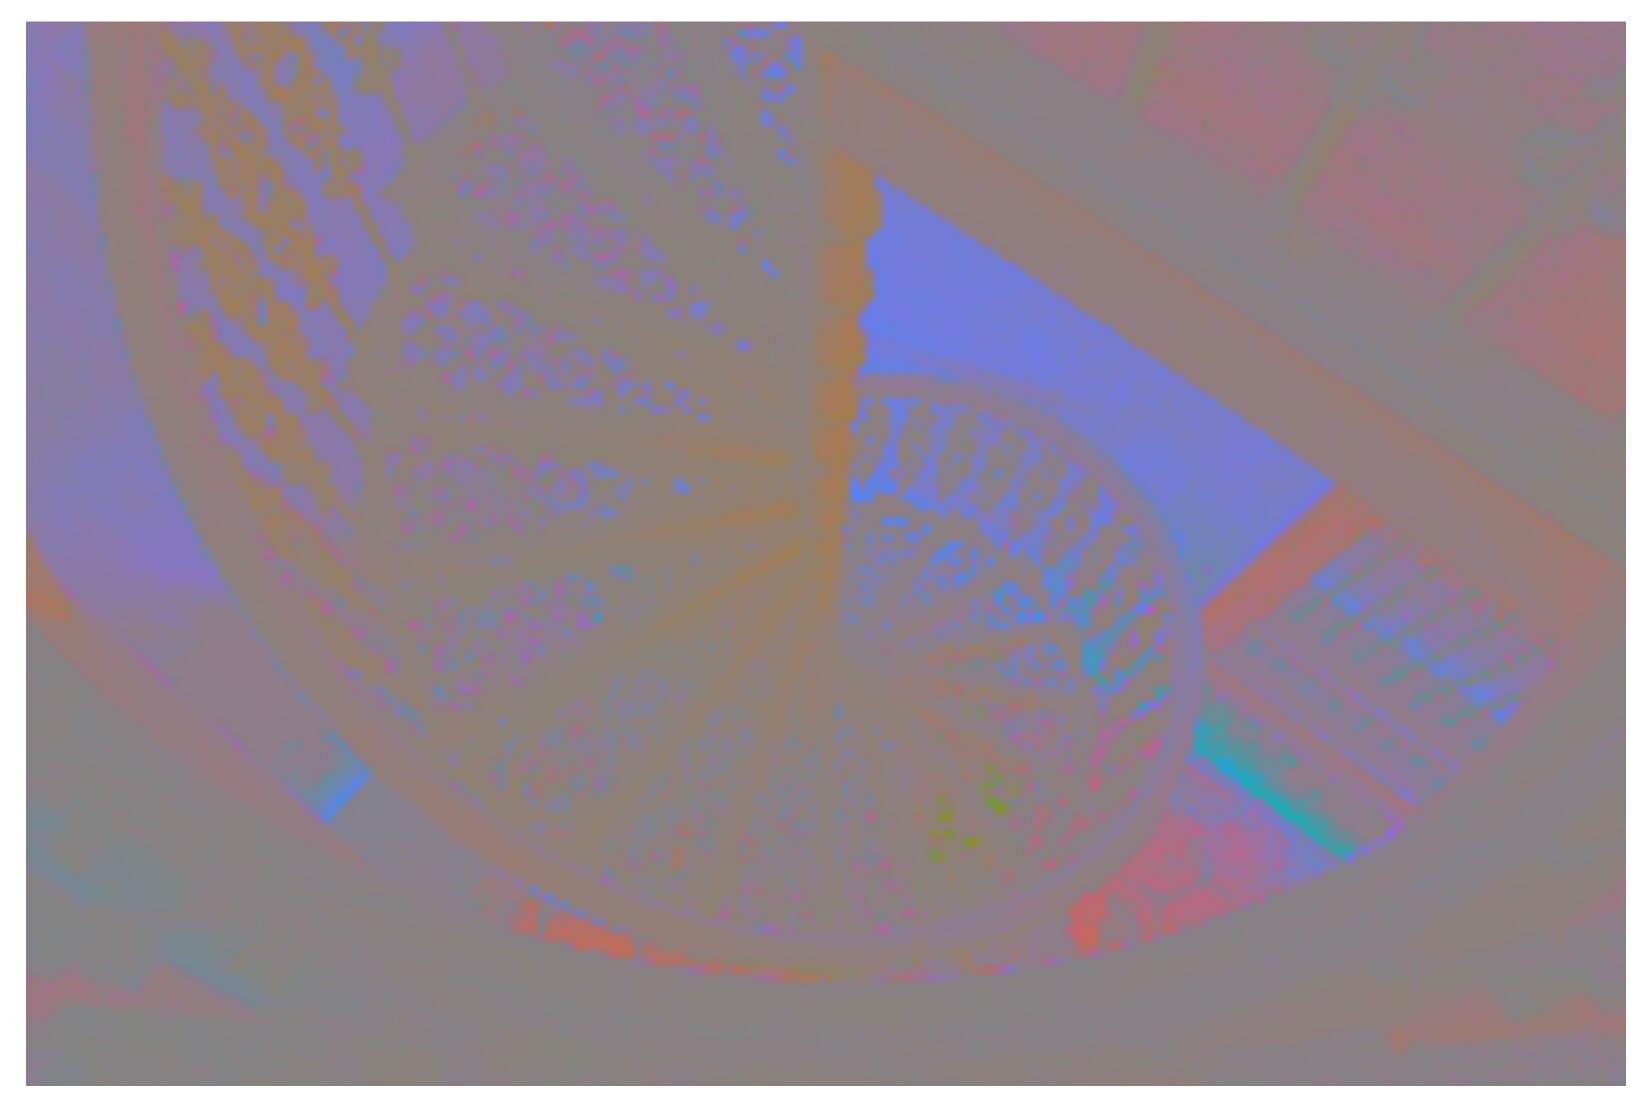

4x4 downsampled luma channel

## CbCr Only (Chroma)

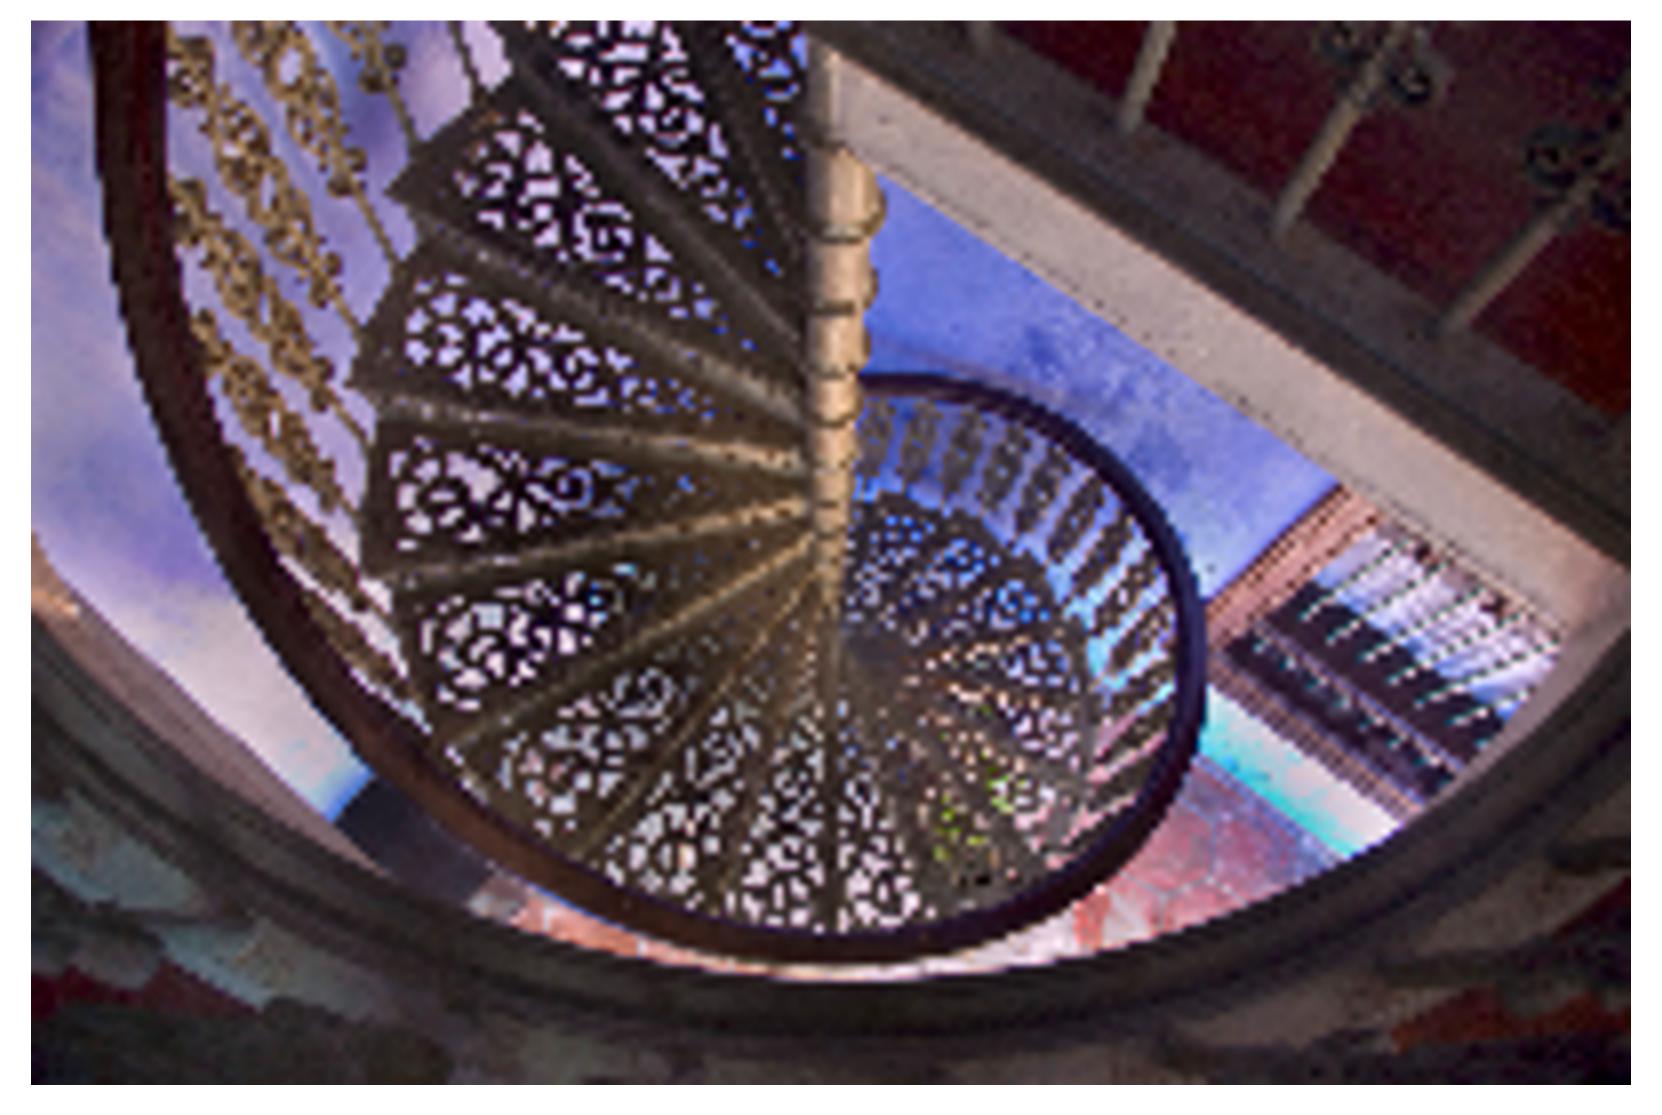

**CbCr channels** 

### Downsampled CbCr

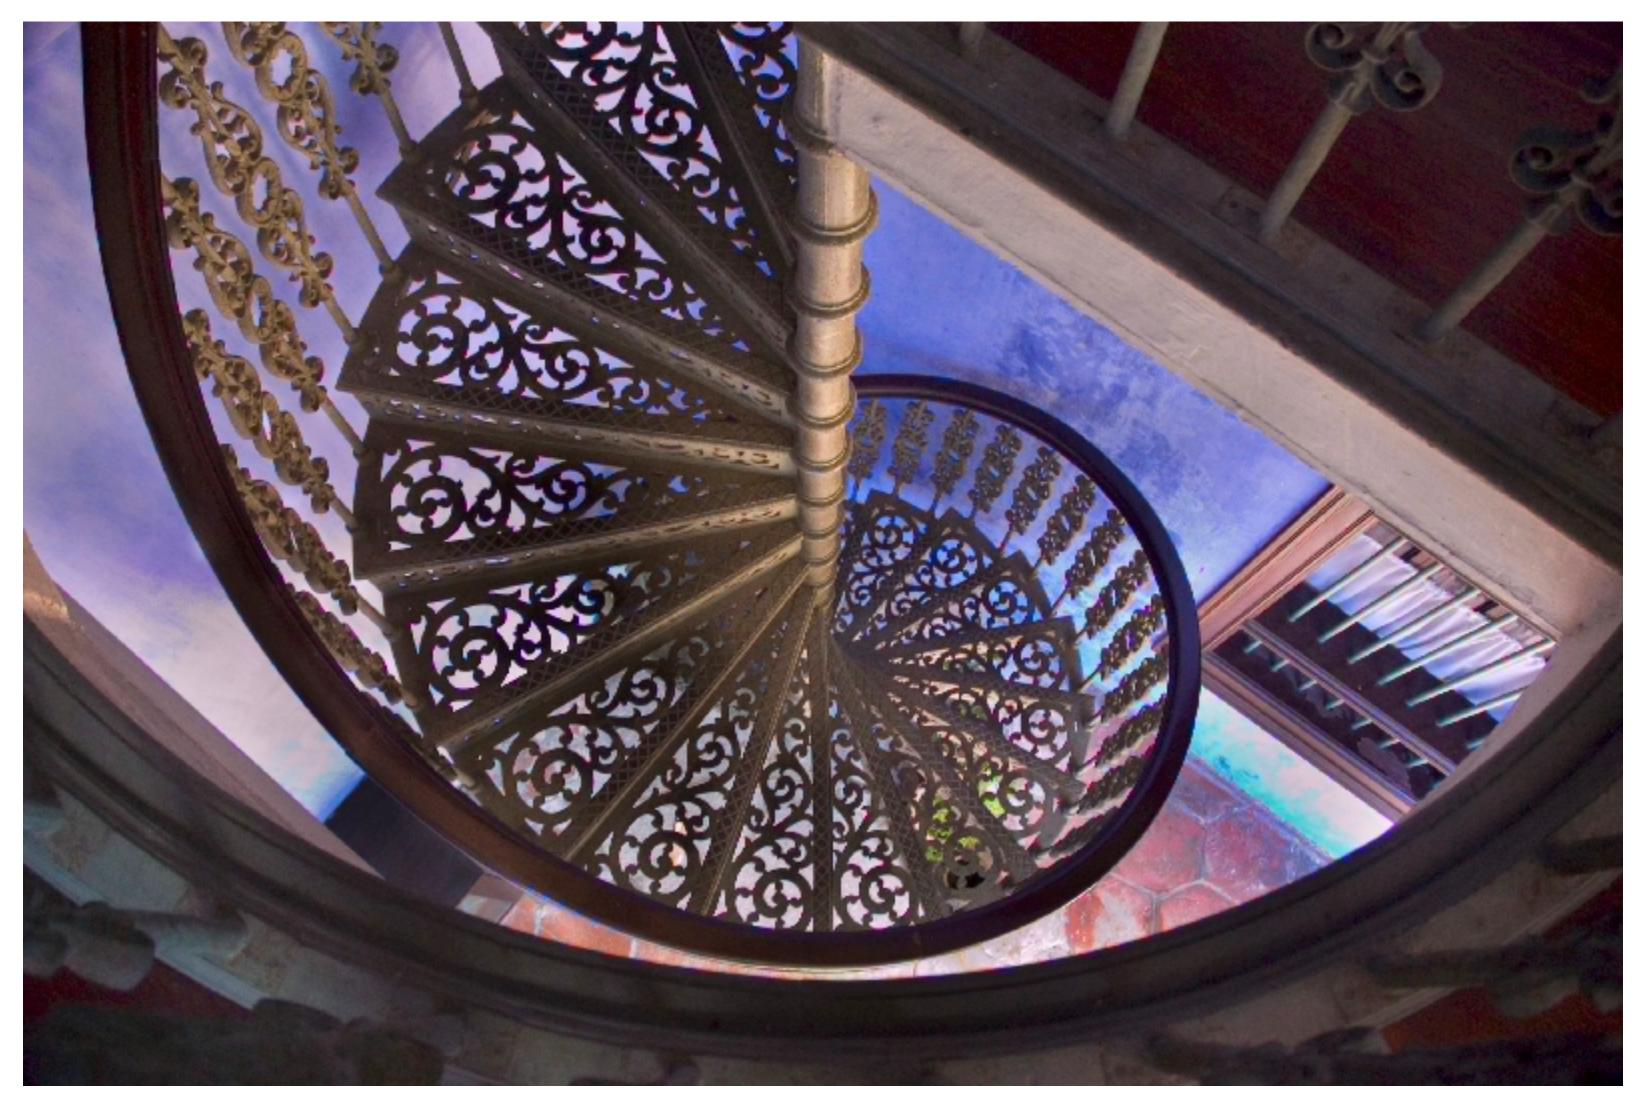

4x4 downsampled CbCr channels

### Example: Compression in Y' Channel

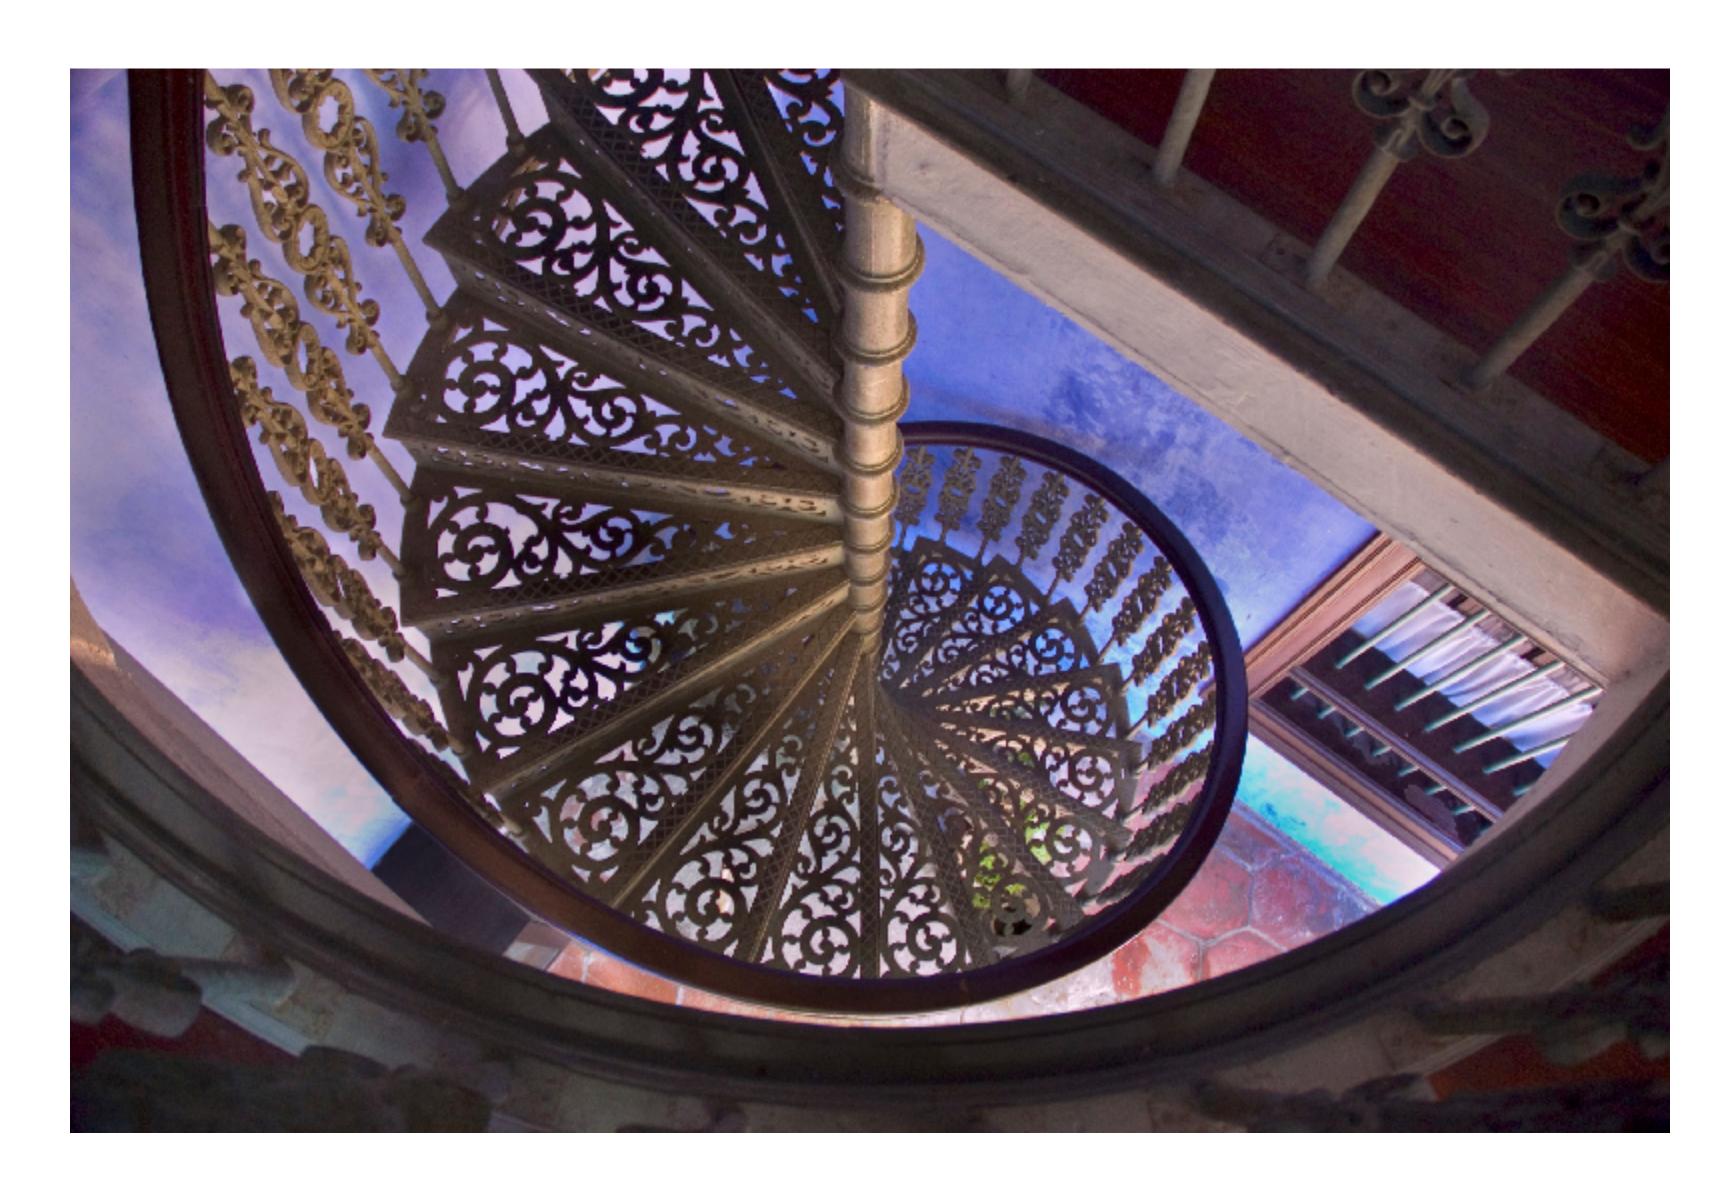

4x4 downsampled Y', full-resolution CbCr

### Example: Compression in CbCr Channels

Full-resolution Y', 4x4 down sampled CbCr

## Original Image

### JPEG: Chroma Subsampling in Y'CbCr Space

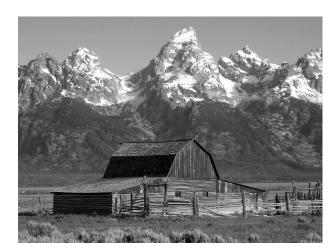

Subsample chroma channels (e.g. to 4:2:2 or 4:2:0 format)

4:2:2 representation: (retain 2/3 values)

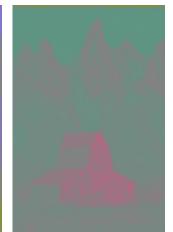

- Store Y' at full resolution
- Store Cb, Cr at half resolution in horizontal dimension

4:2:0 representation: (retain 1/2 values)

- Store Y' at full resolution
- Store Cb, Cr at half resolution in both dimensions

### JPEG: Discrete Cosine Transform (DCT)

basis
$$[i, j] = \cos \left[ \pi \frac{i}{N} \left( x + \frac{1}{2} \right) \right] \times \cos \left[ \pi \frac{j}{N} \left( y + \frac{1}{2} \right) \right]$$

j = 0

In JPEG, Apply discrete cosine transform (DCT) to each 8x8 block of image values

DCT computes projection of image onto 64 basis functions:

basis[i, j]

j = 7

DCT applied to 8x8 pixel blocks of Y' channel, 16x16 pixel blocks of Cb, Cr (assuming 4:2:0)

### JPEG Quantization: Prioritize Low Frequencies

$$\begin{bmatrix} -415 & -30 & -61 & 27 & 56 & -20 & -2 & 0 \\ 4 & -22 & -61 & 10 & 13 & -7 & -9 & 5 \\ -47 & 7 & 77 & -25 & -29 & 10 & 5 & -6 \\ -49 & 12 & 34 & -15 & -10 & 6 & 2 & 2 \\ 12 & -7 & -13 & -4 & -2 & 2 & -3 & 3 \\ -8 & 3 & 2 & -6 & -2 & 1 & 4 & 2 \\ -1 & 0 & 0 & -1 & -4 & -1 & 0 & 1 & 2 \end{bmatrix}$$

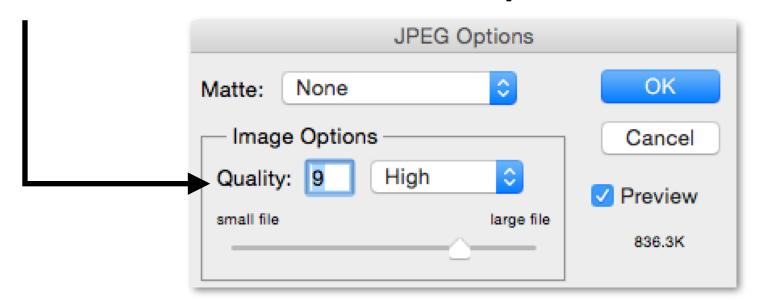

$$\begin{bmatrix} 16 & 11 & 10 & 16 & 24 & 40 & 51 & 61 \\ 12 & 12 & 14 & 19 & 26 & 58 & 60 & 55 \\ 14 & 13 & 16 & 24 & 40 & 57 & 69 & 56 \\ 14 & 17 & 22 & 29 & 51 & 87 & 80 & 62 \\ 18 & 22 & 37 & 56 & 68 & 109 & 103 & 77 \\ 24 & 35 & 55 & 64 & 81 & 104 & 113 & 92 \\ 49 & 64 & 78 & 87 & 103 & 121 & 120 & 101 \\ 72 & 92 & 95 & 98 & 112 & 100 & 103 & 99 \end{bmatrix}$$

#### Result of DCT

(image encoded in cosine basis)

#### **Quantization Matrix**

Changing JPEG quality setting in your favorite photo app modifies this matrix ("lower quality" = higher values for elements in quantization matrix)

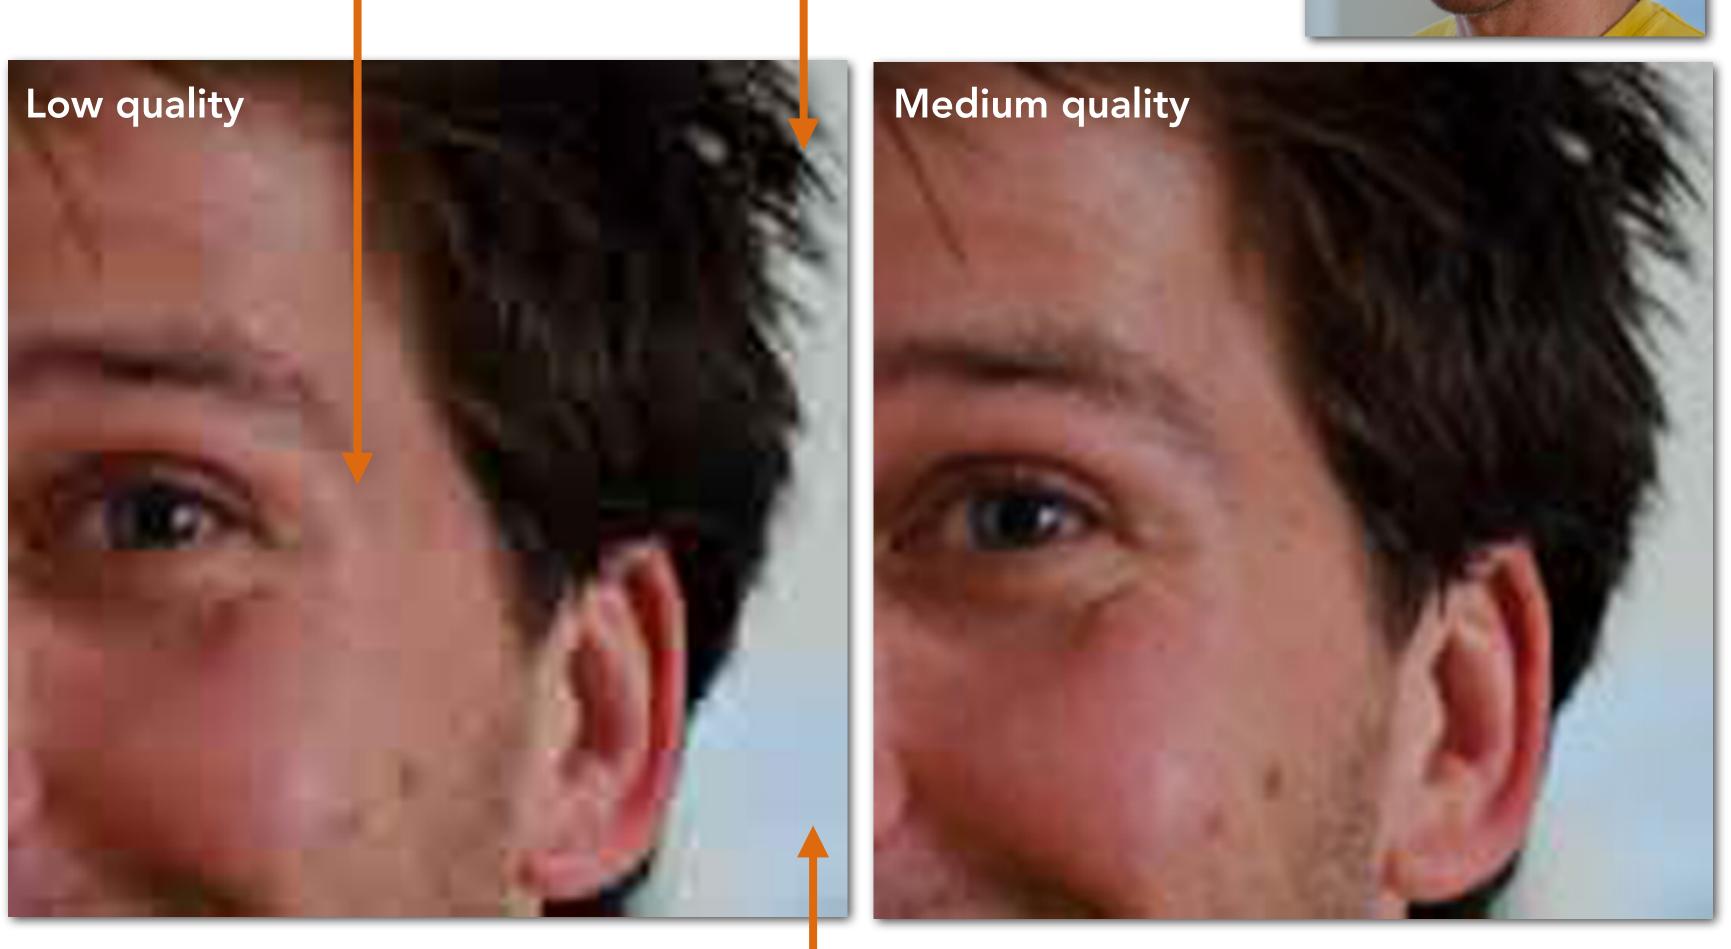

Quantization produces small values for coefficients (only a few bits needed per coefficient)

Observe: quantization zeros out many coefficients

### JPEG: Compression Artifacts

Noticeable 8x8 pixel block boundaries

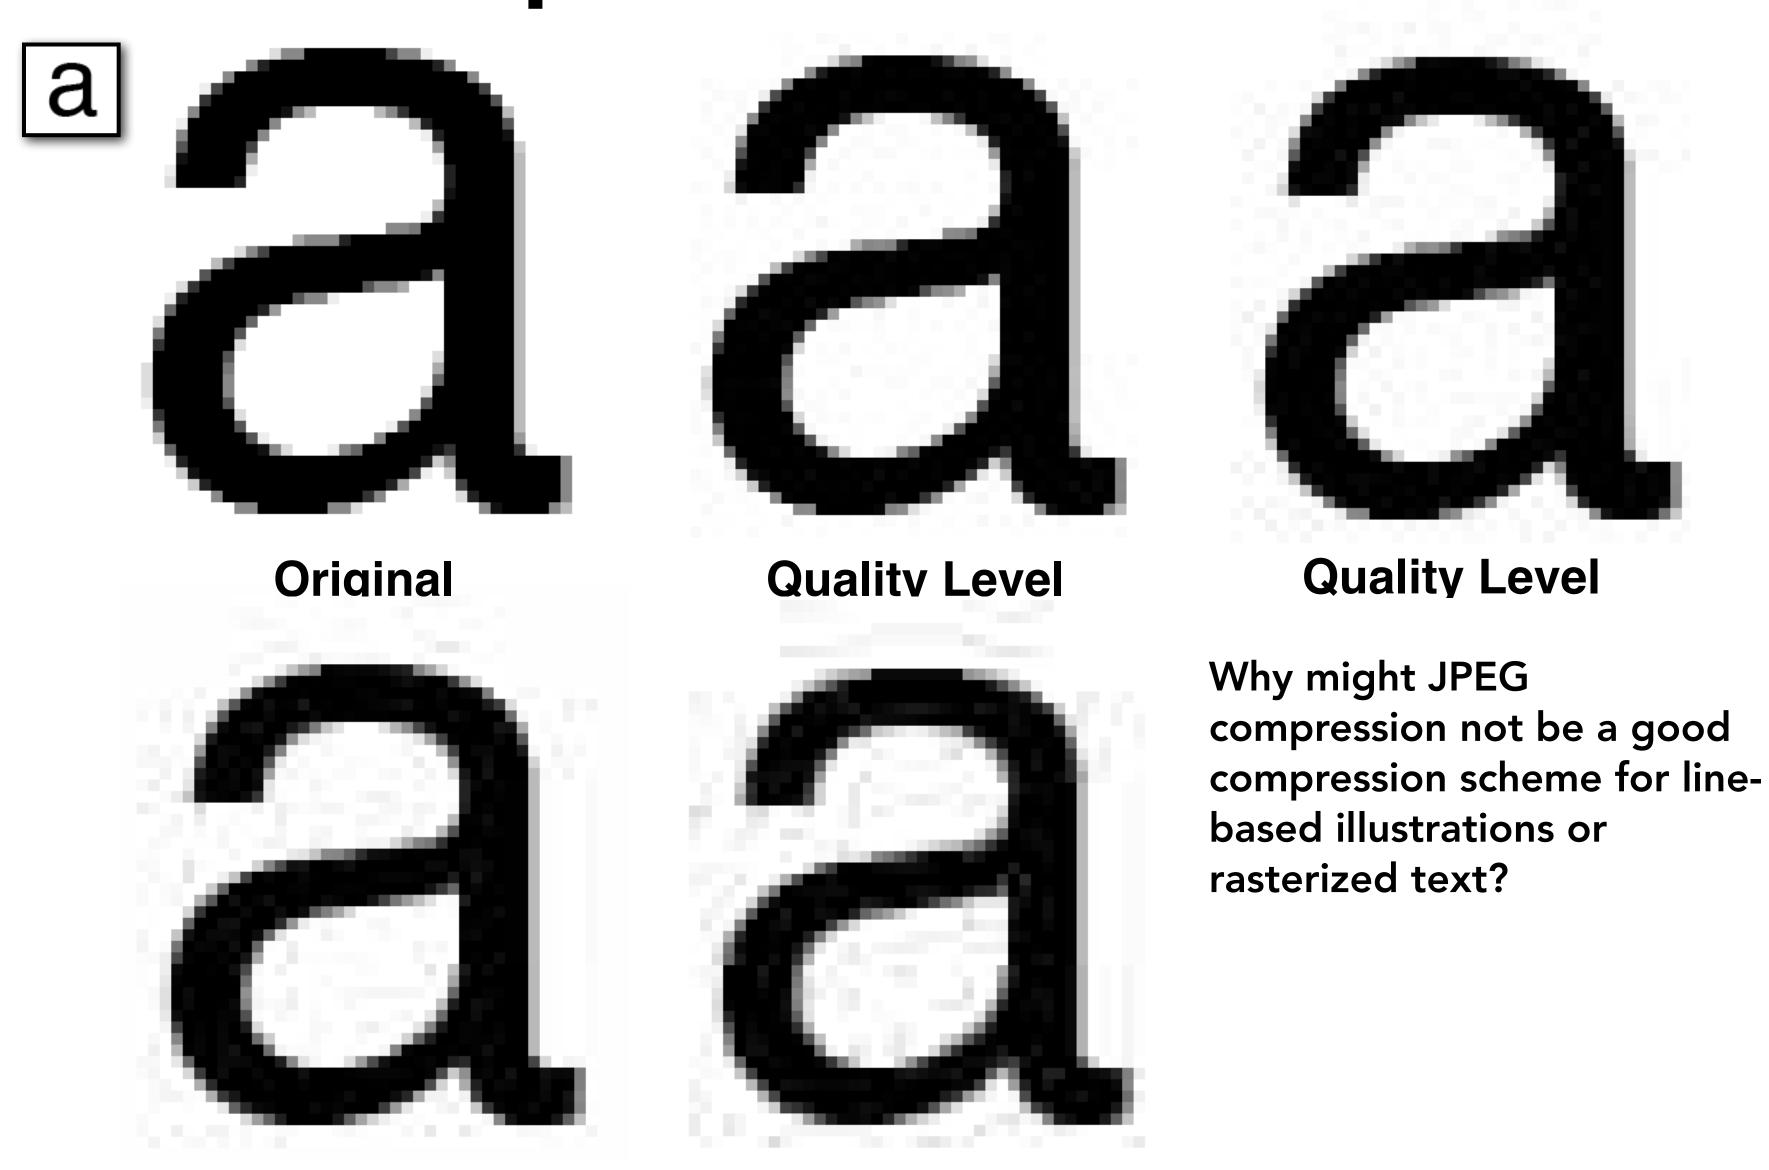

Noticeable error near large color gradients

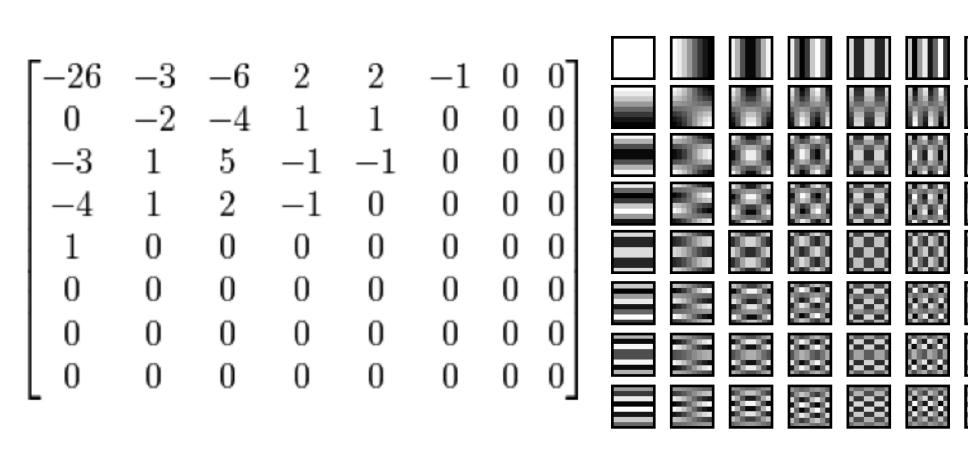

### JPEG: Compression Artifacts

**Quality Level** 

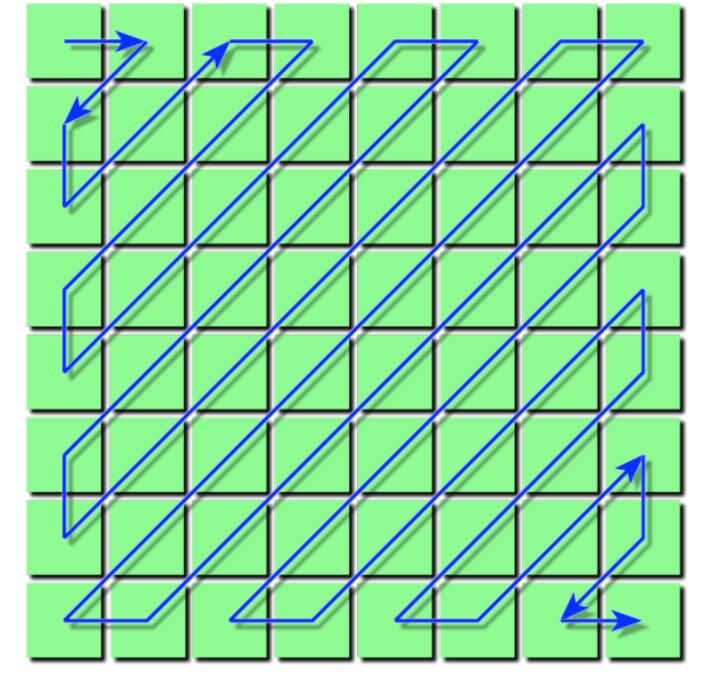

**Quality Level** 

#### Lossless Compression of Quantized DCT Values

**Quantized DCT Values** 

Reordering

Entropy encoding: (lossless)

Reorder values

Run-length encode (RLE) 0's

Huffman encode non-zero values

### JPEG Compression Summary

Convert image to Y'CbCr color space

Downsample CbCr (to 4:2:2 or 4:2:0) (information loss occurs here)

For each color channel (Y', Cb, Cr):

For each 8x8 block of values

**Compute DCT** 

Quantize results

(information loss occurs here)

Reorder values

Run-length encode 0-spans

Huffman encode non-zero values

CS184/284A Ren Ng

### Theme: Exploit Perception in Visual Computing

JPEG is an example of a general theme of exploiting characteristics of human perception to build efficient visual computing systems

We are perceptually insensitive to color errors:

 Separate luminance from chrominance in color representations (e.g, Y'CbCr) and compress chrominance

We are less perceptually sensitive to high-frequency error

 Use a frequency-based encoding (cosine transform) and compress high-frequency values

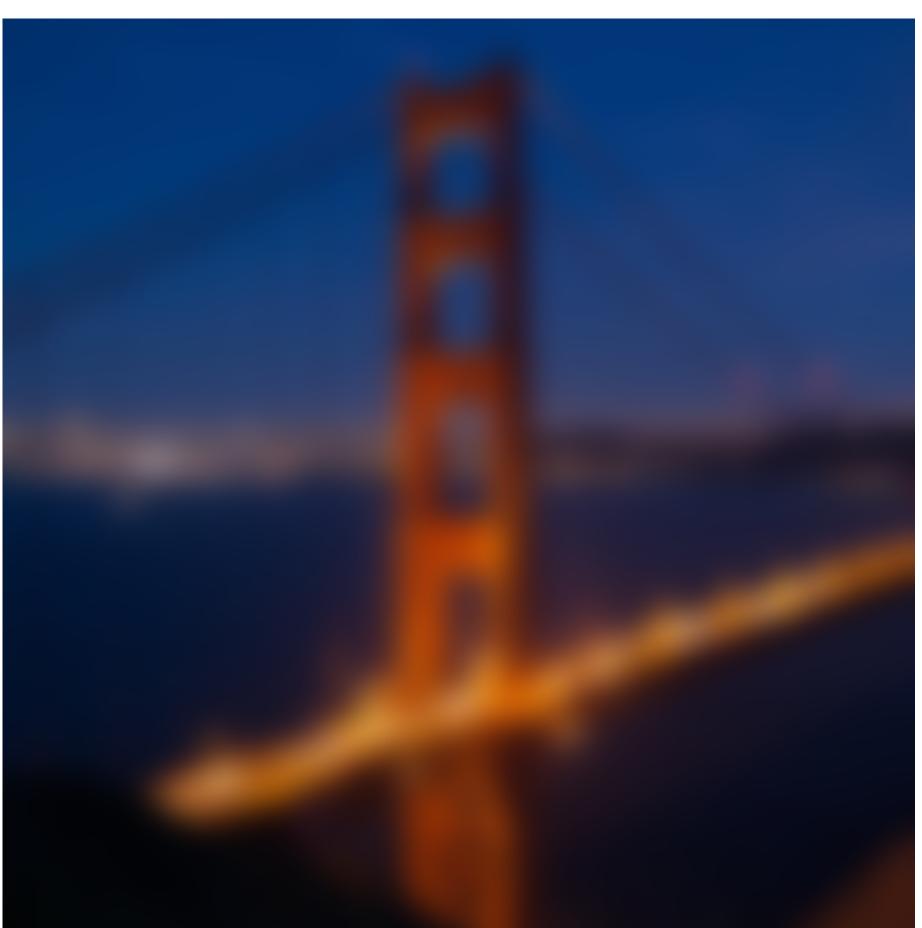

We perceive lightness non-linearly (not discussed in this lecture)

 Encode pixel values non-linearly to match perceived brightness using gamma curve

### Basic Image Processing Operations

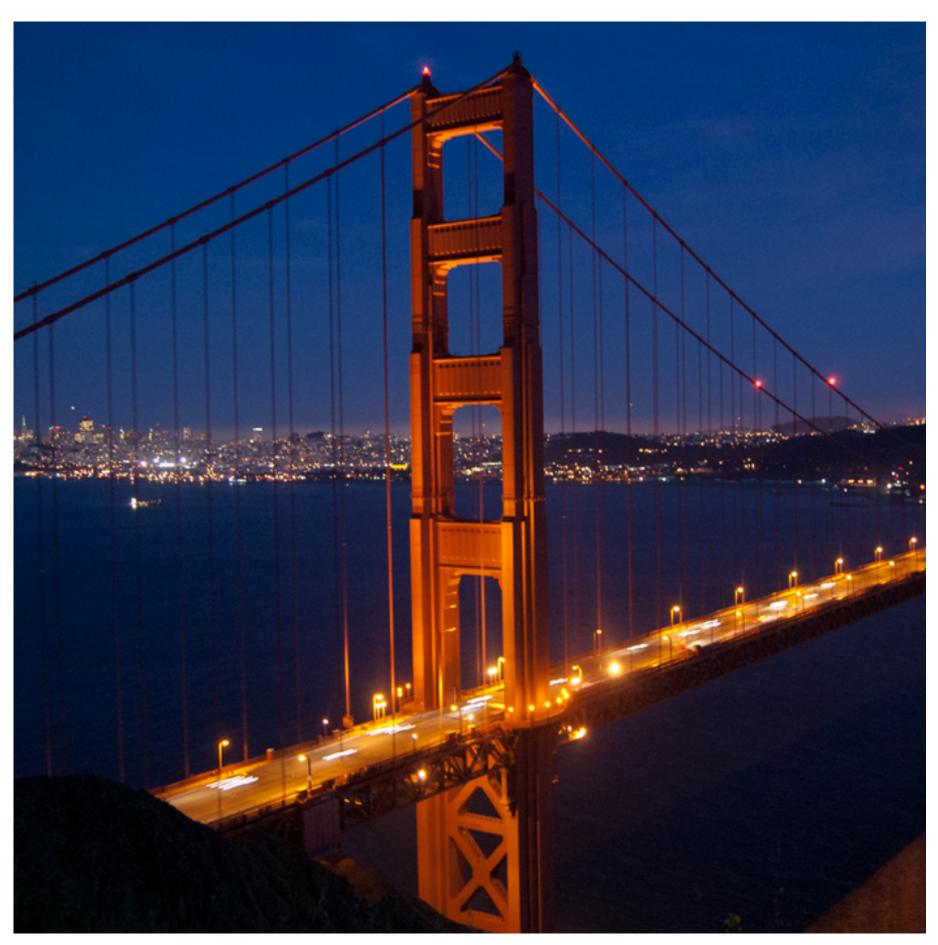

### Example Image Processing Operations

Blur

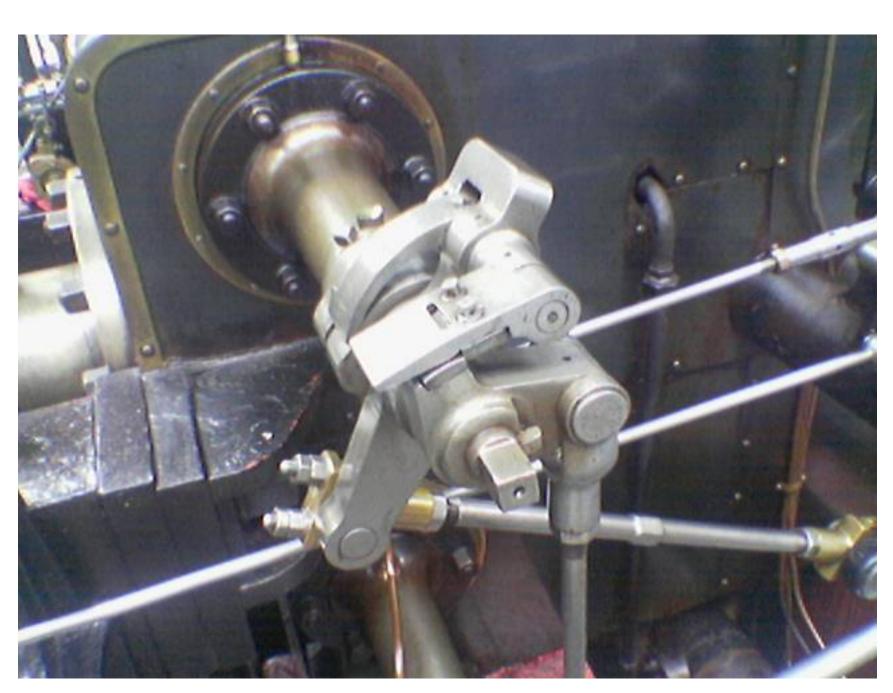

### Example Image Processing Operations

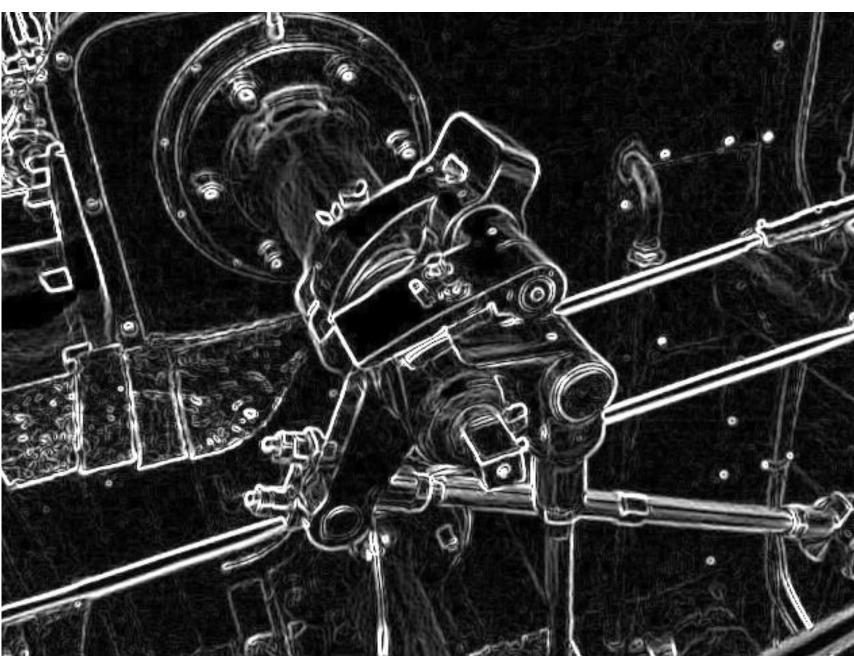

Sharpen

### Edge Detection

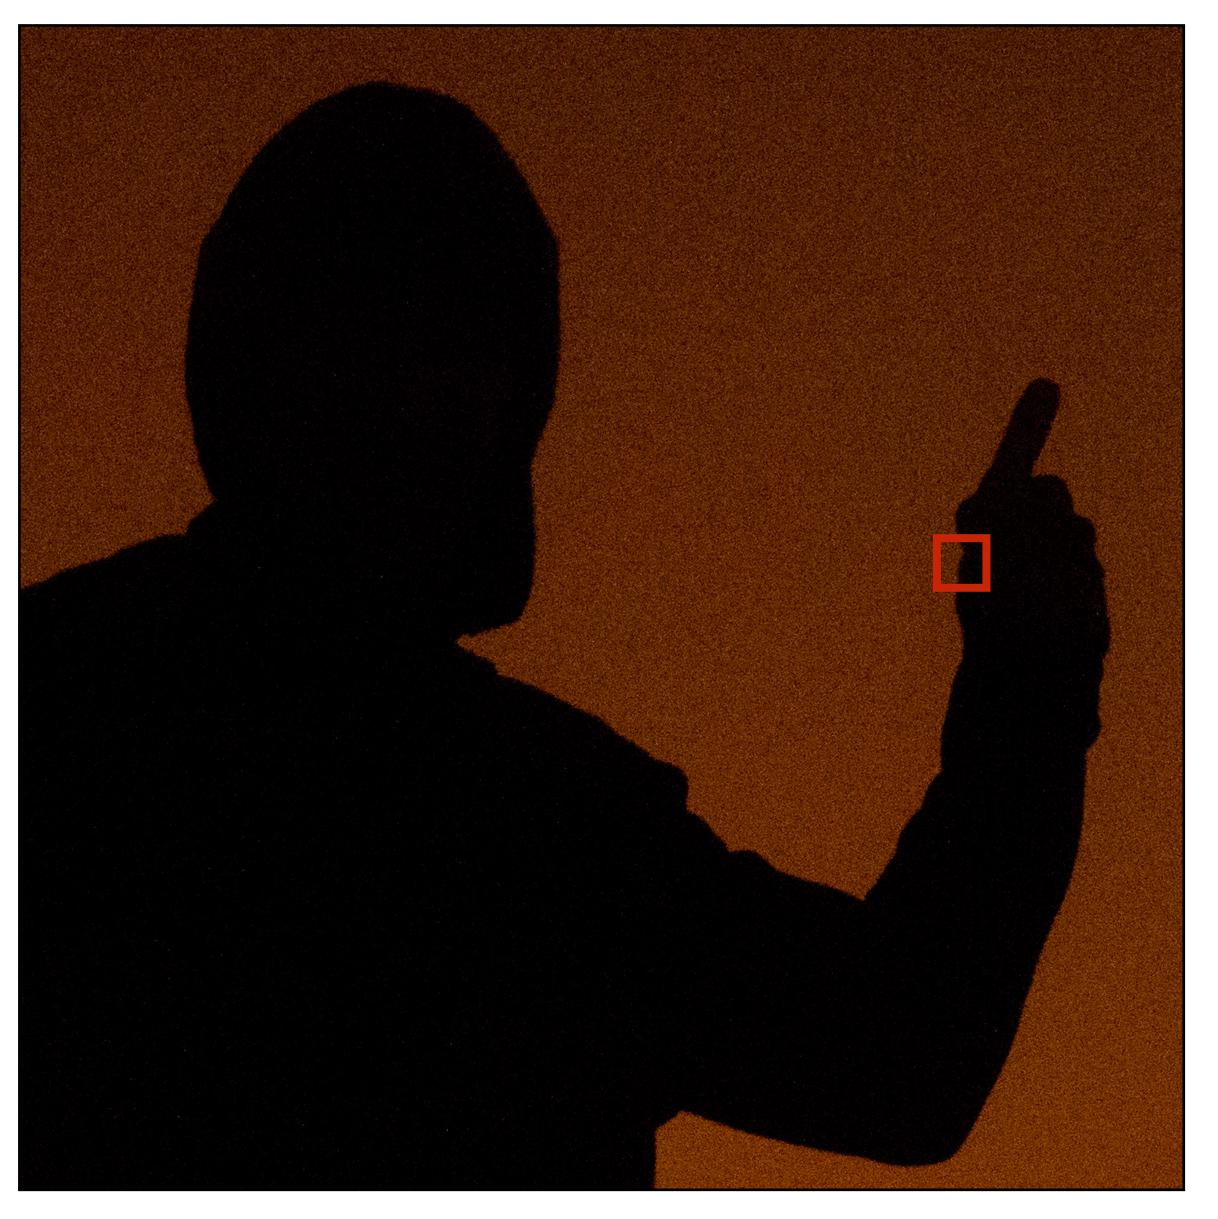

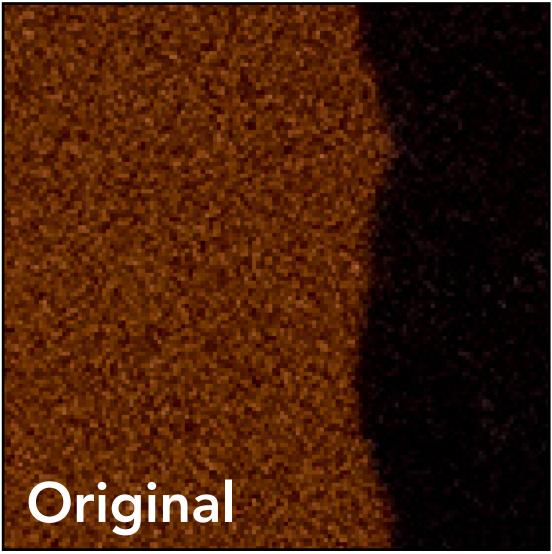

### A "Smarter" Blur (Preserves Crisp Edges)

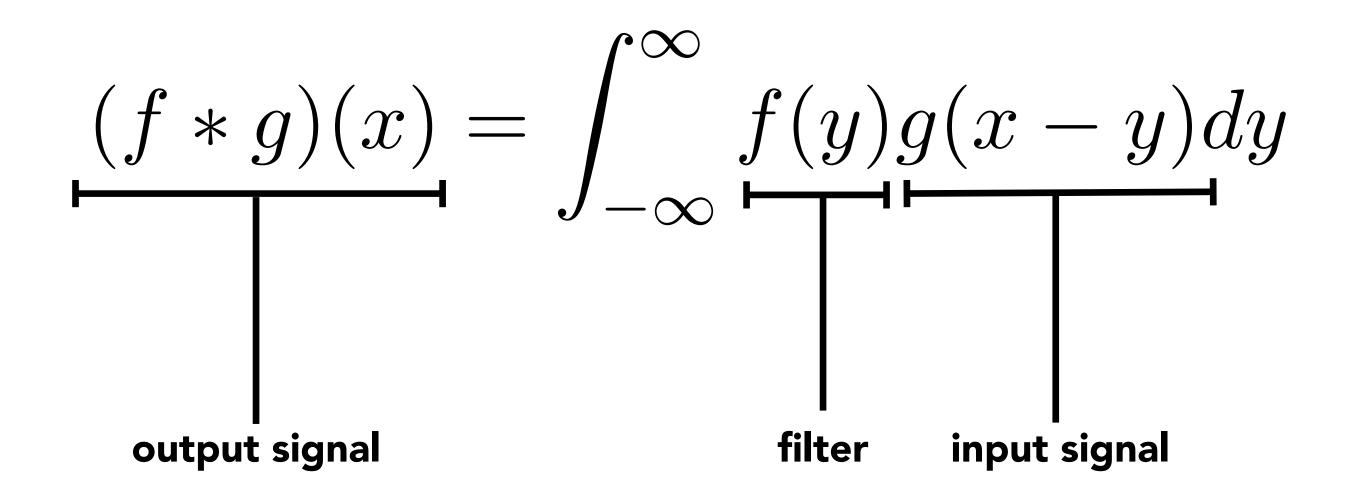

### Denoising

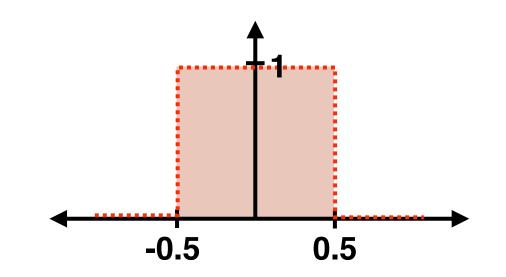

#### Review: Convolution

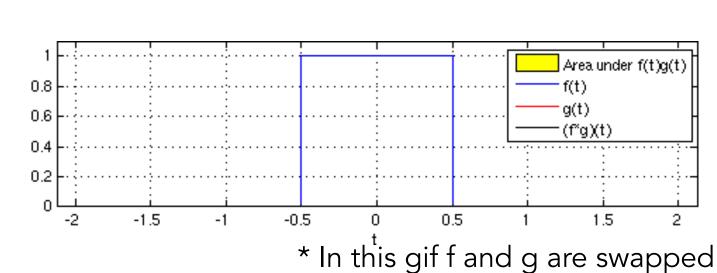

**Example: convolution with "box" function:** 

$$f(x) = \begin{cases} 1 & |x| \le 0.5 \\ 0 & otherwise \end{cases}$$

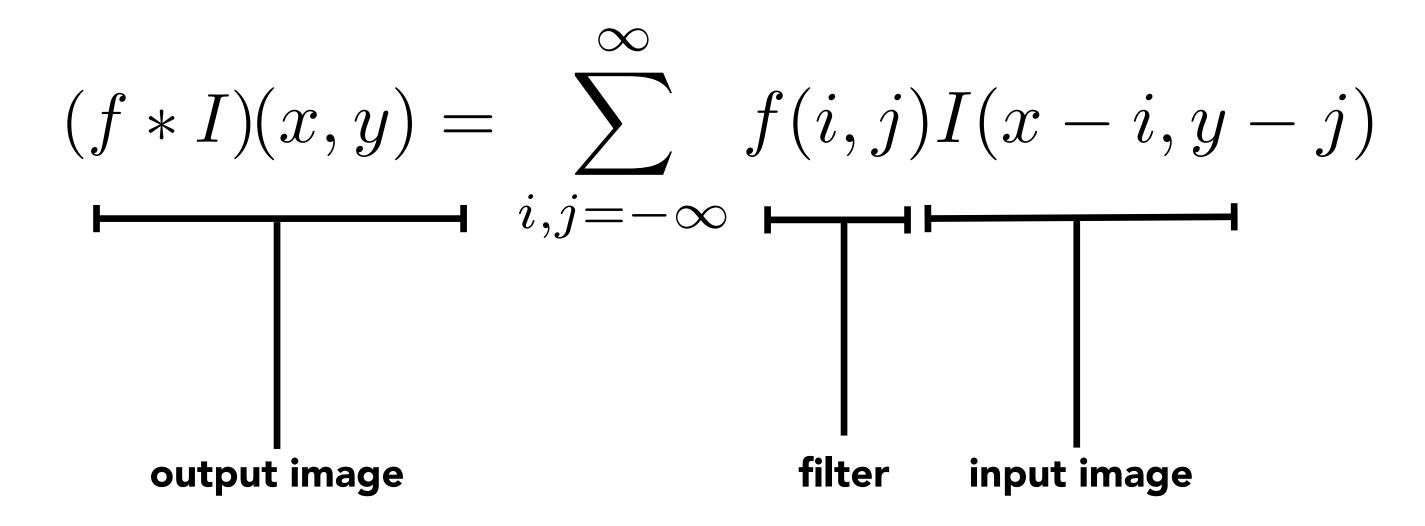

$$(f * g)(x) = \int_{-0.5}^{0.5} g(x - y) dy$$

f \* g is a "smoothed" version of g

#### Discrete 2D Convolution

Consider f(i,j) that is nonzero only when:  $-1 \leq i,j \leq 1$ 

Then: 
$$(f*g)(x,y) = \sum_{i,j=-1}^1 f(i,j)I(x-i,y-j)$$

And we can represent f(i,j) as a 3x3 matrix of values.

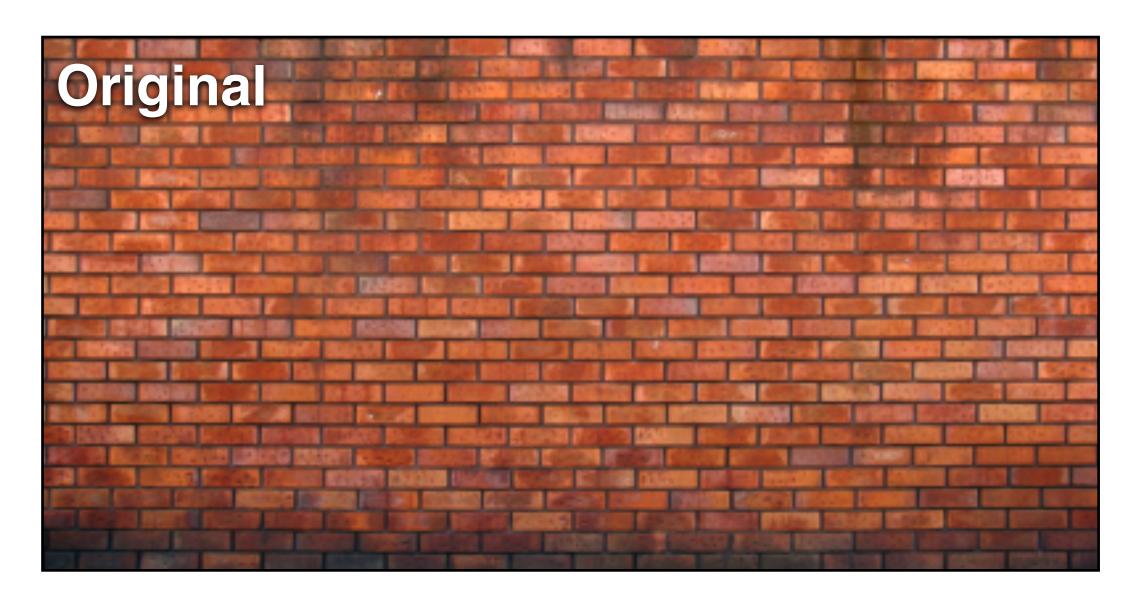

These values are often called "filter weights" or the "kernel".

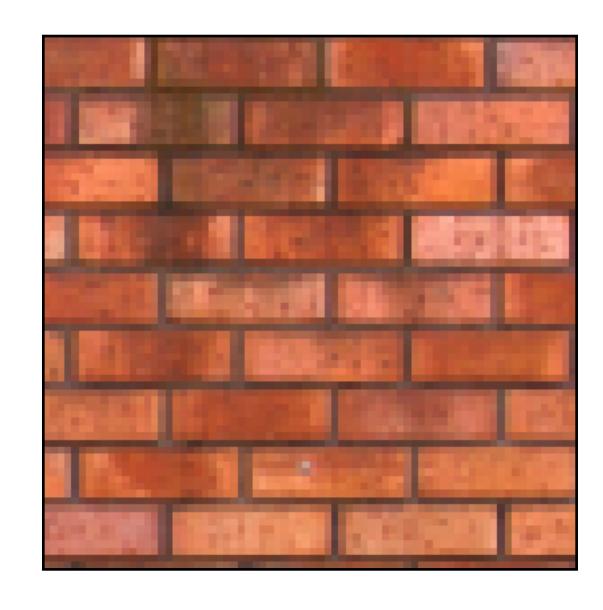

### Simple 3x3 Box Blur

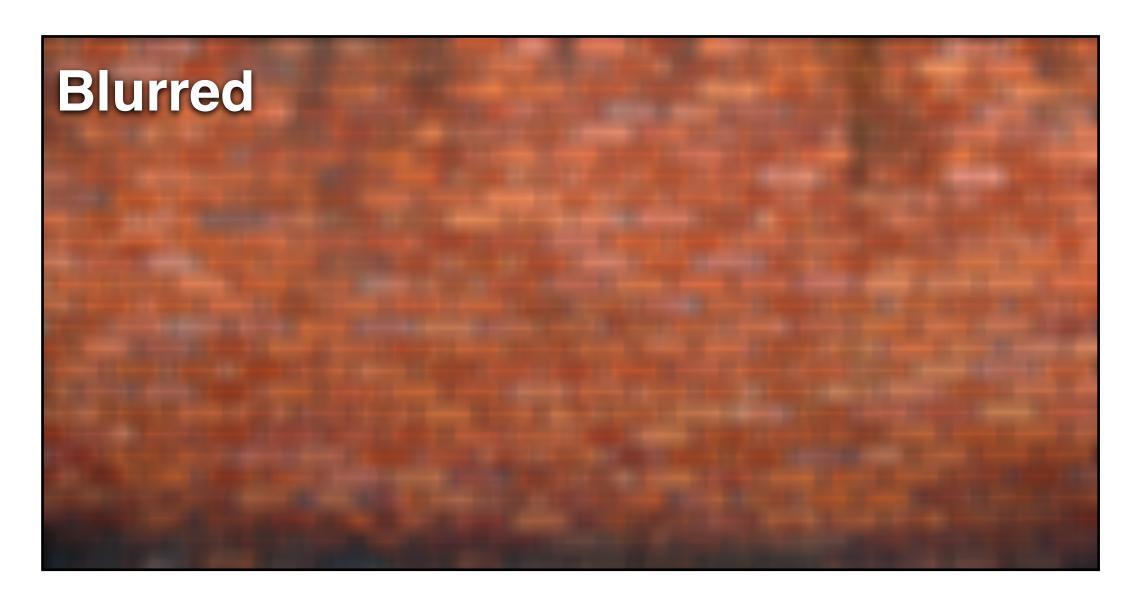

```
Will ignore boundary pixels
float input[(WIDTH+2) * (HEIGHT+2)];
                                                                                                                                                                                                                                                                                                                    today and assume output
float output[WIDTH * HEIGHT];
                                                                                                                                                                                                                                                                                                                    image is smaller than input
                                                                                                                                                                                                                                                                                                                     (makes convolution loop
                                                                                                                                                                                                                                                                                                                    bounds much simpler to write)
float weights[] = \{1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./
                                                             1./9, 1./9, 1./9,
                                                             1./9, 1./9, 1./9};
for (int j=0; j<HEIGHT; j++) {
         for (int i=0; i<WIDTH; i++) {
                   float tmp = 0.f;
                   for (int jj=0; jj<3; jj++)
                            for (int ii=0; ii<3; ii++)
                                      tmp += input[(j+jj)*(WIDTH+2) + (i+ii)] * weights[jj*3 + ii];
                   output[j*WIDTH + i] = tmp;
```

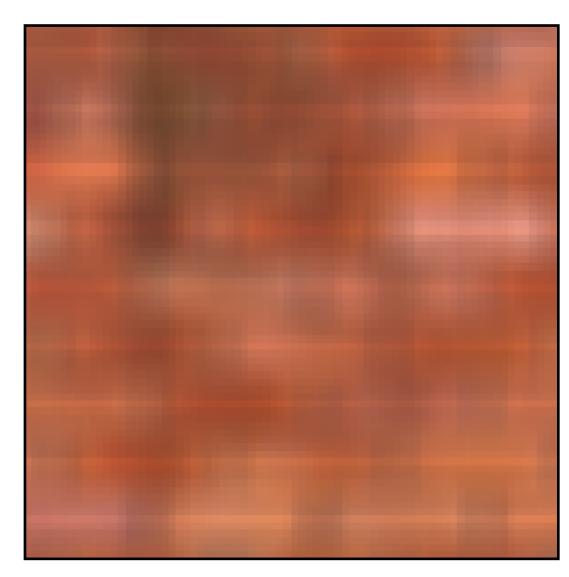

CS184/284A

### 7x7 Box Blur

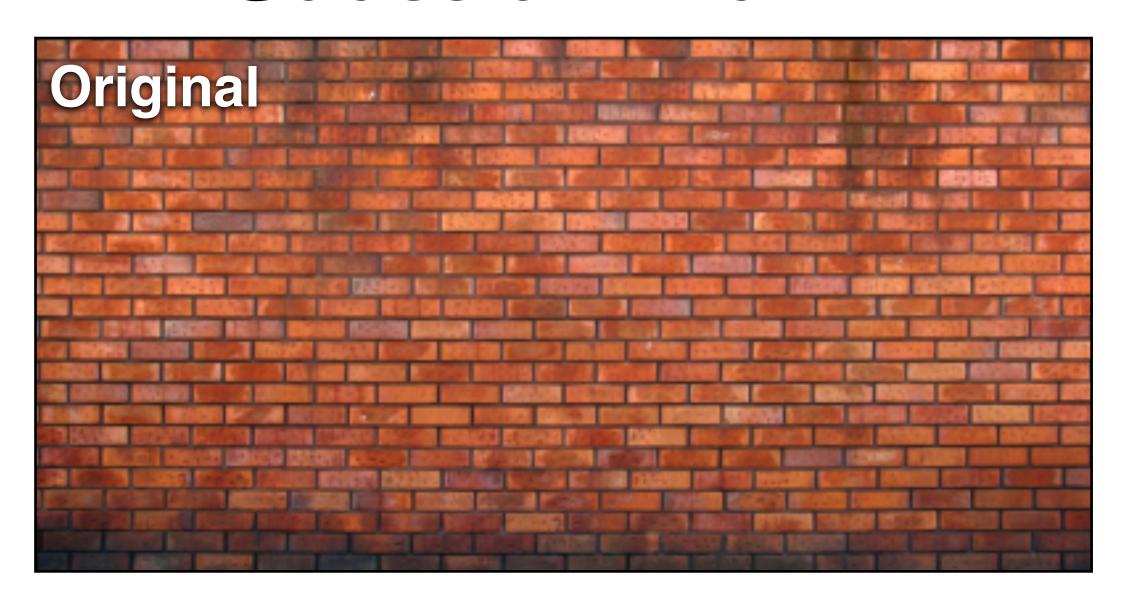

#### Gaussian Blur

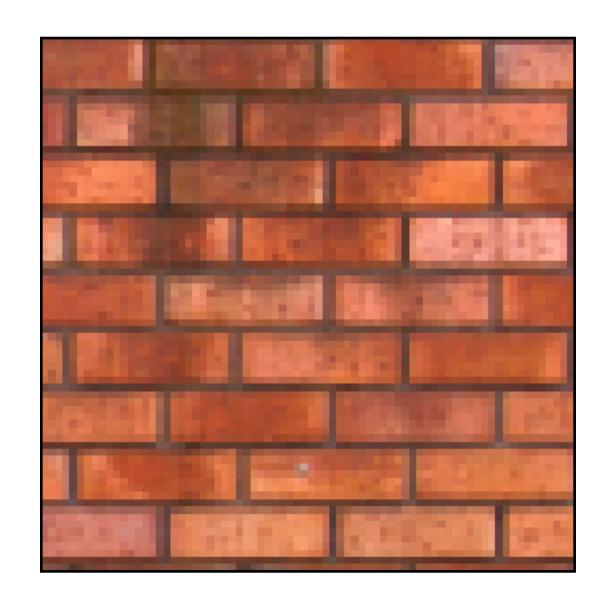

Obtain filter coefficients from sampling 2D Gaussian

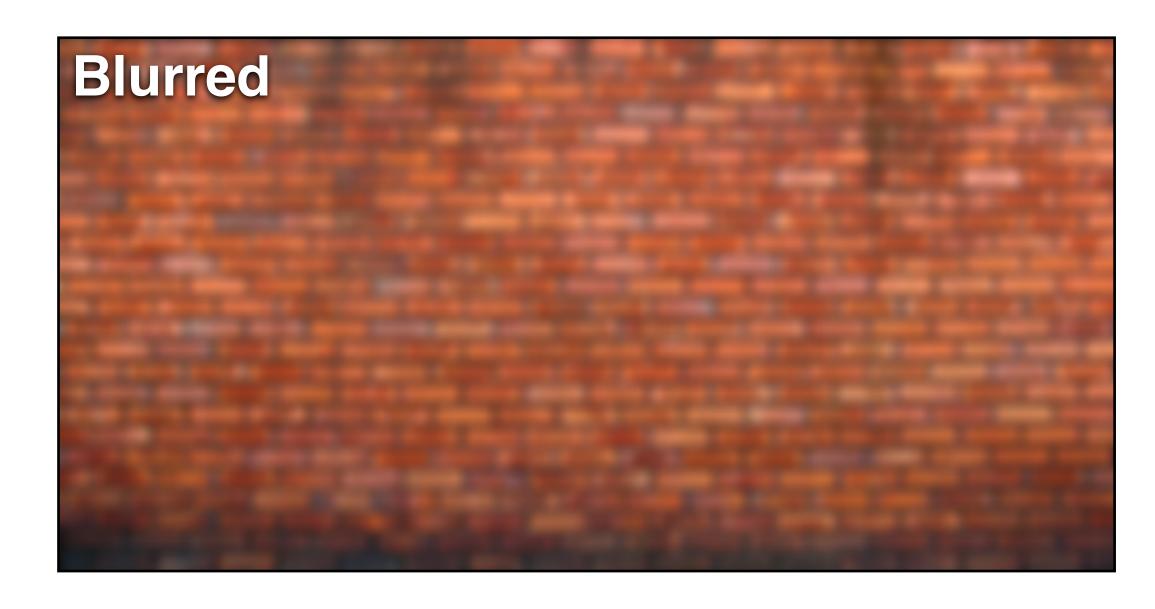

$$f(i,j) = \frac{1}{2\pi\sigma^2} e^{-\frac{i^2+j^2}{2\sigma^2}}$$

- Produces weighted sum of neighboring pixels (contribution falls off with distance)
  - Truncate filter beyond certain distance

### 7x7 Gaussian Blur

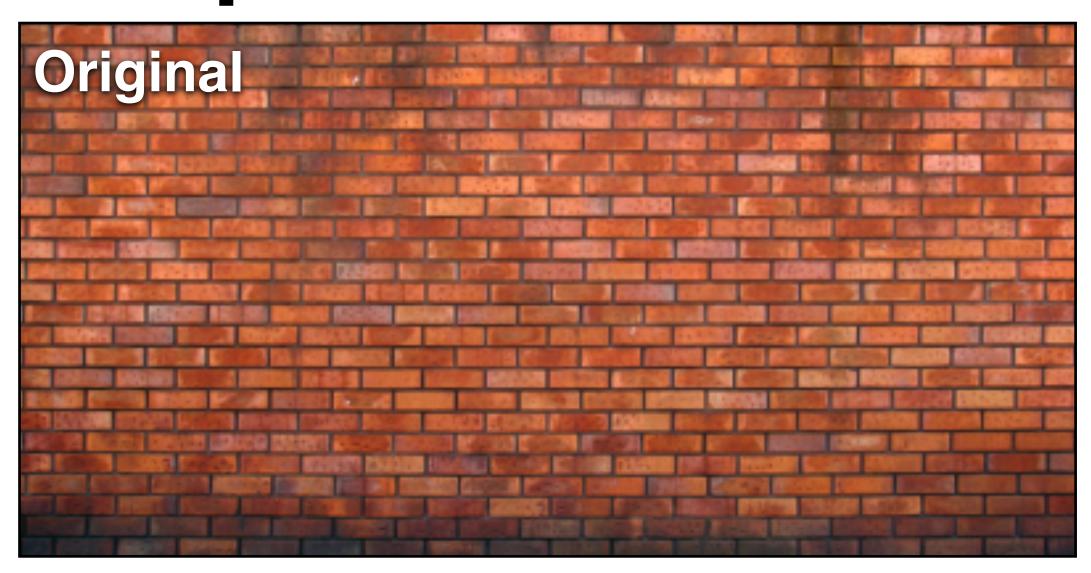

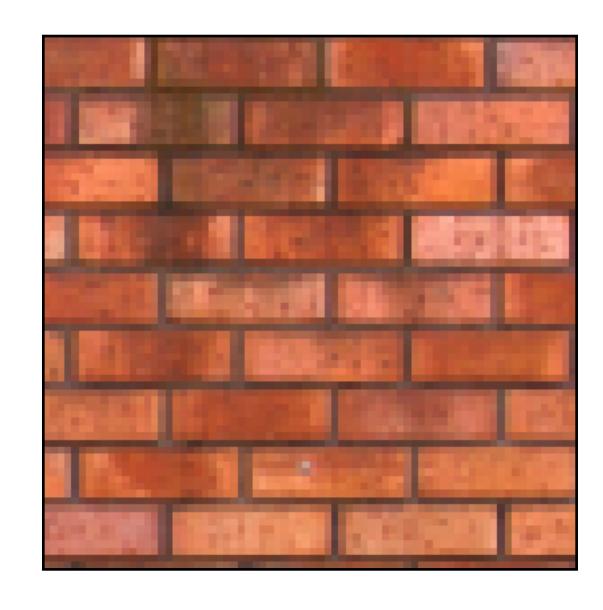

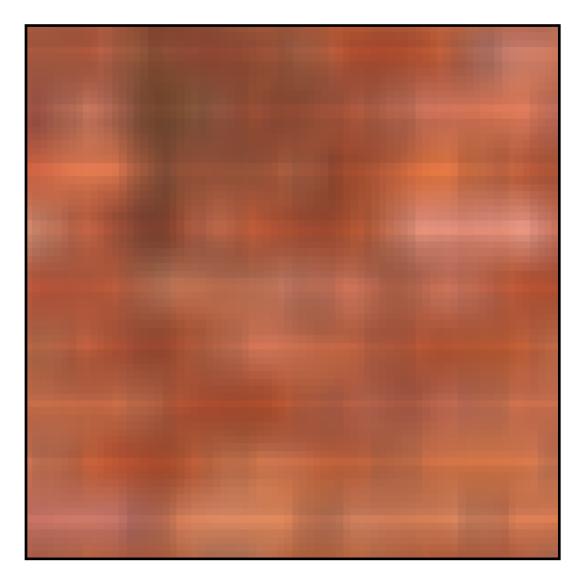

### Compare: 7x7 Box Blur

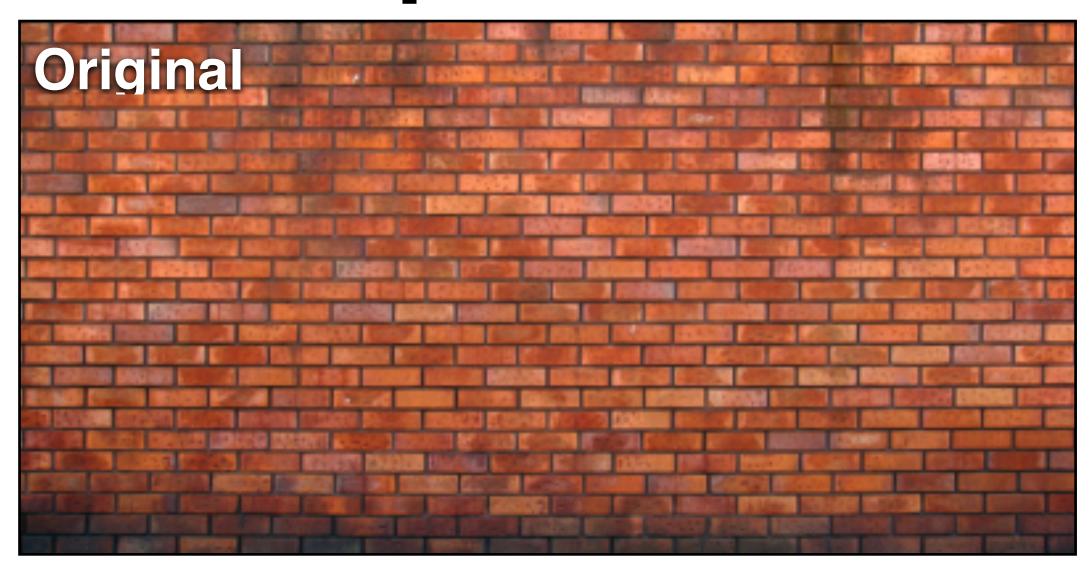

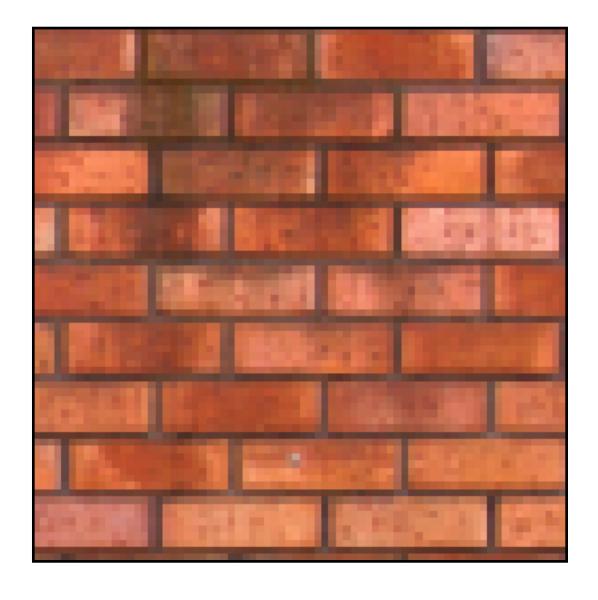

#### What Does Convolution with this Filter Do?

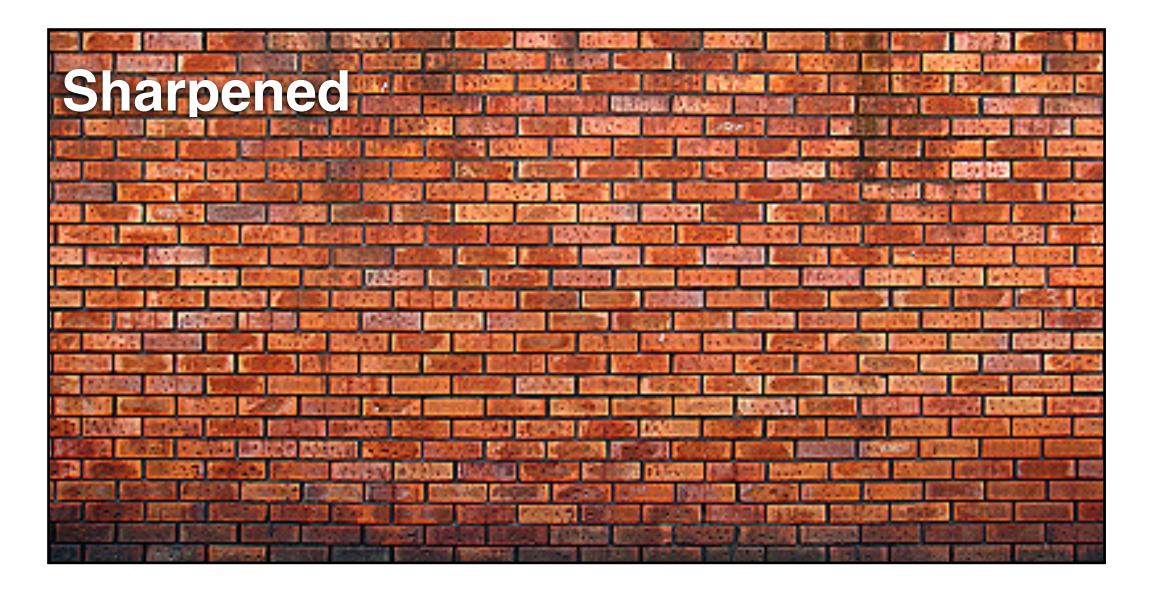

$$\begin{bmatrix} 0 & -1 & 0 \\ -1 & 5 & -1 \\ 0 & -1 & 0 \end{bmatrix}$$

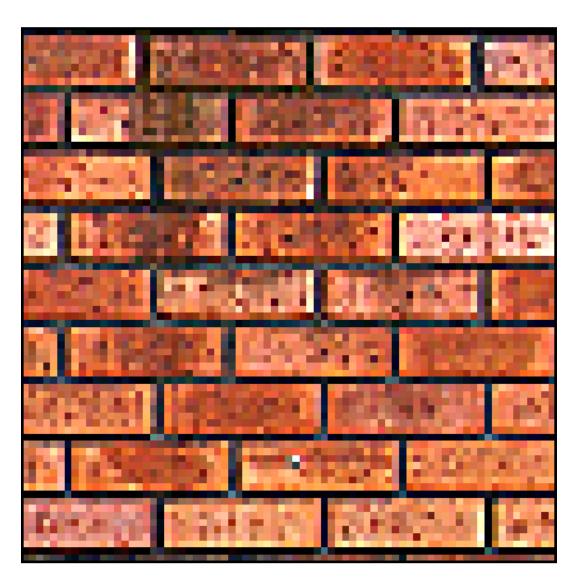

Sharpens image!

### 3x3 Sharpen Filter

#### What Does Convolution with these Filters Do?

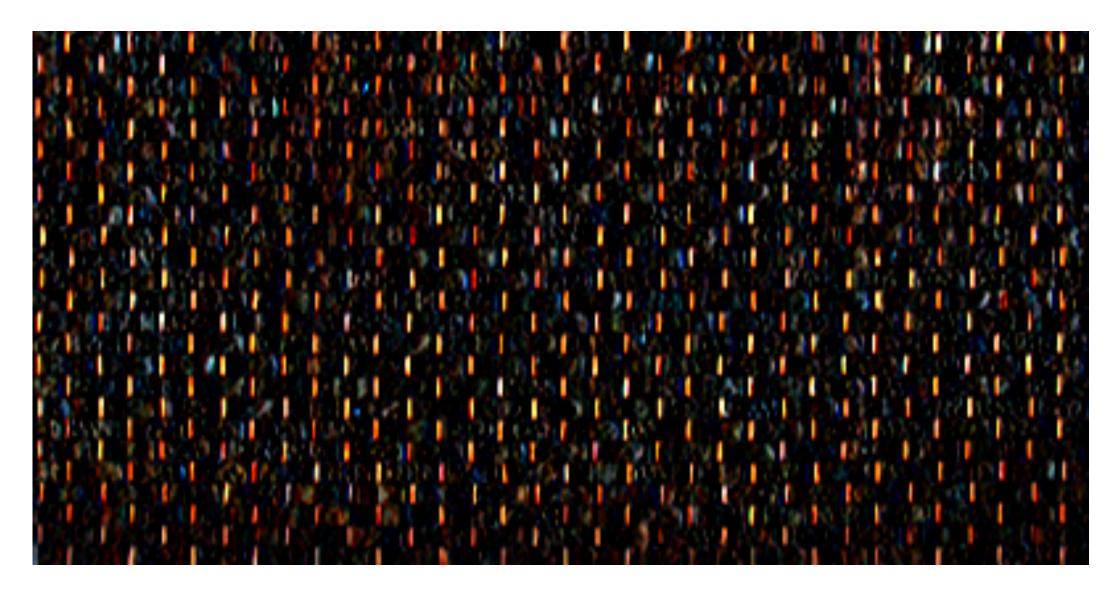

$$egin{bmatrix} -1 & 0 & 1 \ -2 & 0 & 2 \ -1 & 0 & 1 \ \end{bmatrix}$$

$$\begin{bmatrix} -1 & 0 & 1 \\ -2 & 0 & 2 \\ -1 & 0 & 1 \end{bmatrix} \qquad \begin{bmatrix} -1 & -2 & -1 \\ 0 & 0 & 0 \\ 1 & 2 & 1 \end{bmatrix}$$

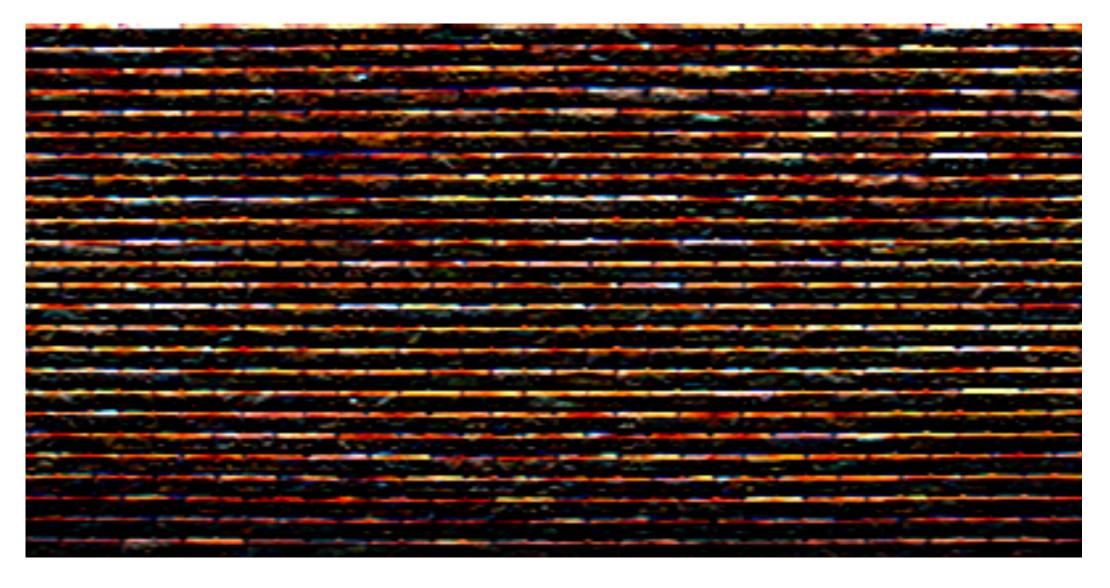

**Extracts horizontal** gradients

**Extracts vertical** gradients

#### Gradient Detection Filters

#### Horizontal gradients

#### Vertical gradients

Note: you can think of a filter as a "detector" of a pattern, and the magnitude of a pixel in the output image as the "response" of the filter to the region surrounding each pixel in the input image (this is a common interpretation in computer vision)

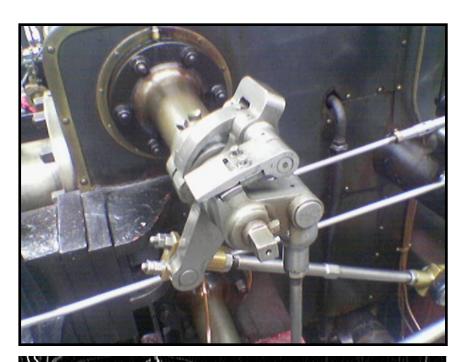

## Sobel Edge Detection

$$G_{x} = \begin{bmatrix} -1 & 0 & 1 \\ -2 & 0 & 2 \\ -1 & 0 & 1 \end{bmatrix} * I$$

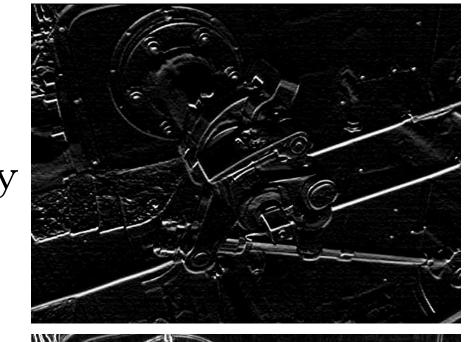

$$G_{y} = \begin{bmatrix} -1 & -2 & -1 \\ 0 & 0 & 0 \\ 1 & 2 & 1 \end{bmatrix} * I$$

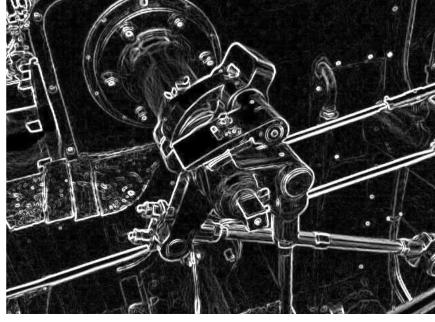

#### Find pixels with large gradients

$$G = \sqrt{{G_x}^2 + {G_y}^2}$$
 Pixel-wise operation on images

# Algorithmic Cost of Convolution-Based Image Processing

#### Cost of Convolution with N x N Filter?

```
In this 3x3 box blur example:
float input[(WIDTH+2) * (HEIGHT+2)];
                                                                                                                                                                                                                                                                         Total work per image = 9 x WIDTH x HEIGHT
float output[WIDTH * HEIGHT];
                                                                                                                                                                                                                                                                         For N x N filter: N2 x WIDTH x HEIGHT
float weights[] = \{1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./9, 1./
                                                               1./9, 1./9, 1./9,
                                                               1./9, 1./9, 1./9};
for (int j=0; j<HEIGHT; j++) {
         for (int i=0; i<WIDTH; i++) {
                   float tmp = 0.f;
                   for (int jj=0; jj<3; jj++)
                             for (int ii=0; ii<3; ii++)
                                       tmp += input[(j+jj)*(WIDTH+2) + (i+ii)] * weights[jj*3 + ii];
                   output[j*WIDTH + i] = tmp;
```

CS184/284A

## Separable Filters

A filter is separable if is the product of two other filters

Examples: a 2D box blur

$$\frac{1}{9} \begin{bmatrix} 1 & 1 & 1 \\ 1 & 1 & 1 \\ 1 & 1 & 1 \end{bmatrix} = \frac{1}{3} \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix} * \frac{1}{3} [1 \quad 1 \quad 1]$$

 Exercise: write 2D gaussian and vertical/horizontal gradient detection filters as product of 1D filters (they are separable!)

Key property: 2D convolution with separable filter can be written as two 1D convolutions!

#### Fast 2D Box Blur via Two 1D Convolutions

```
int WIDTH = 1024
int HEIGHT = 1024;
float input[(WIDTH+2) * (HEIGHT+2)];
float tmp_buf[WIDTH * (HEIGHT+2)];
float output[WIDTH * HEIGHT];
float weights[] = \{1./3, 1./3, 1./3\};
for (int j=0; j<(HEIGHT+2); j++)
 for (int i=0; i<WIDTH; i++) {
  float tmp = 0.f;
  for (int ii=0; ii<3; ii++)
   tmp += input[j*(WIDTH+2) + i+ii] * weights[ii];
  tmp_buf[j*WIDTH + i] = tmp;
for (int j=0; j<HEIGHT; j++) {
 for (int i=0; i<WIDTH; i++) {
  float tmp = 0.f;
  for (int jj=0; jj<3; jj++)
   tmp += tmp_buf[(j+jj)*WIDTH + i] * weights[jj];
  output[j*WIDTH + i] = tmp;
```

Total work per image =  $6 \times WIDTH \times HEIGHT$ 

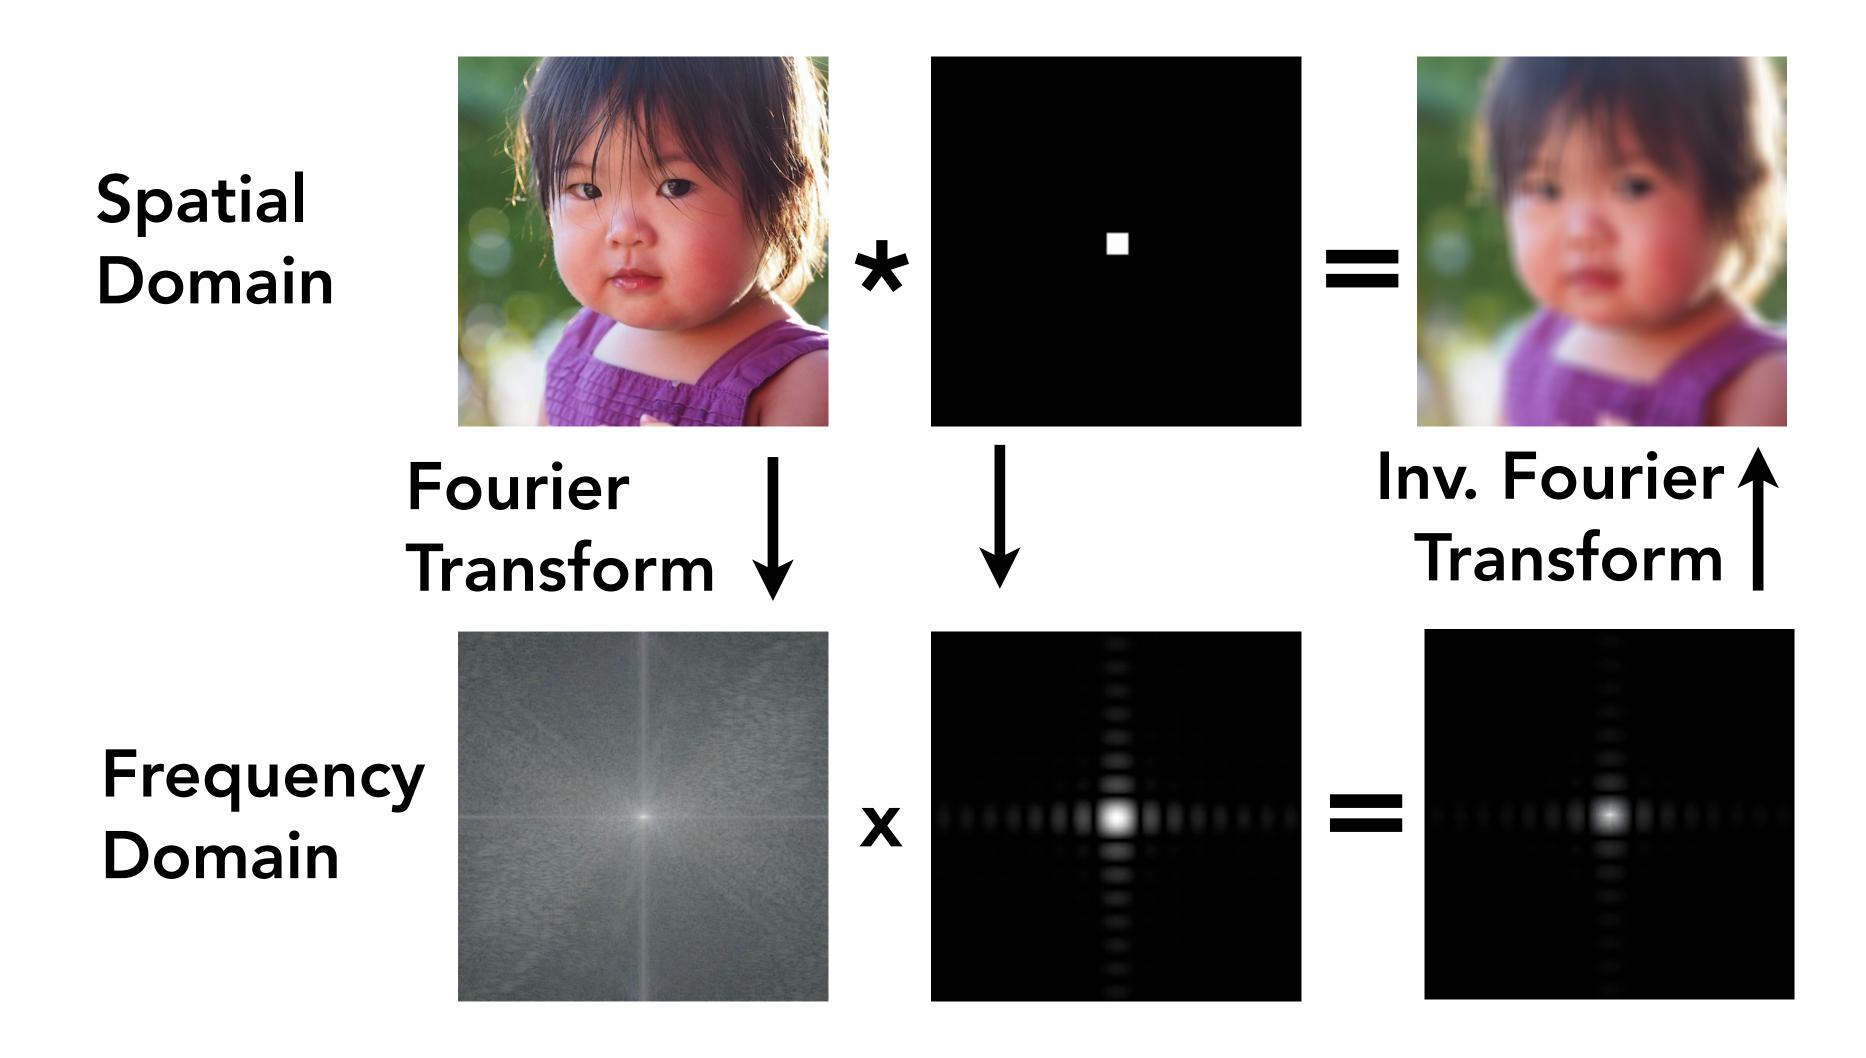

For NxN filter: 2N x WIDTH x HEIGHT

Extra cost of this approach?

Storage!

Challenge: can you achieve this work complexity without incurring this cost?

### Recall: Convolution Theorem

CS184/284A

Ng & Kanazawa

# Efficiency?

When is it faster to implement a filter by convolution in the spatial domain?

When is it faster to implement a filter by multiplication in the frequency domain?

CS184/284A

# Data-Dependent Filters

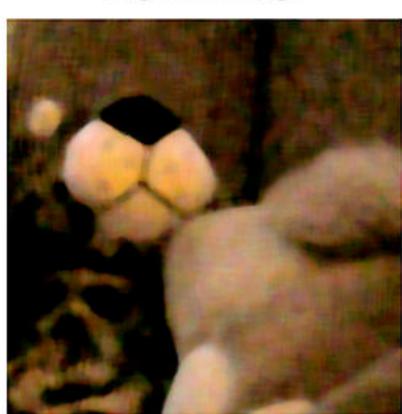

#### Median Filter

- Replace pixel with median of its neighbors
  - Useful noise reduction filter: unlike gaussian blur, one bright pixel doesn't drag up the average for entire region
- Not linear, not separable
  - Filter weights are 1 or 0
     (depending on image content)

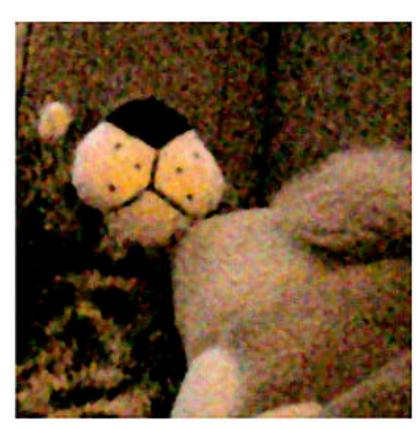

```
uint8 input[(WIDTH+2) * (HEIGHT+2)];
uint8 output[WIDTH * HEIGHT];
for (int j=0; j<HEIGHT; j++)
  for (int i=0; i<WIDTH; i++)
    output[j*WIDTH + i] =
    // compute median of pixels
    // in surrounding 5x5 pixel window</pre>
```

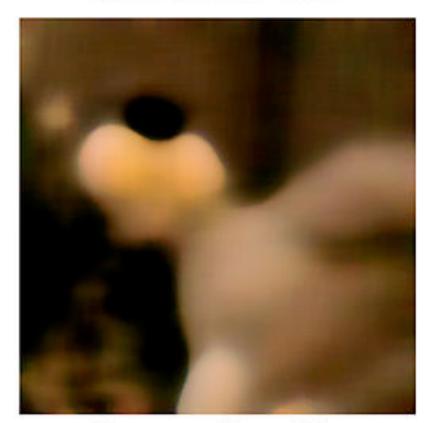

original image

3px median filter

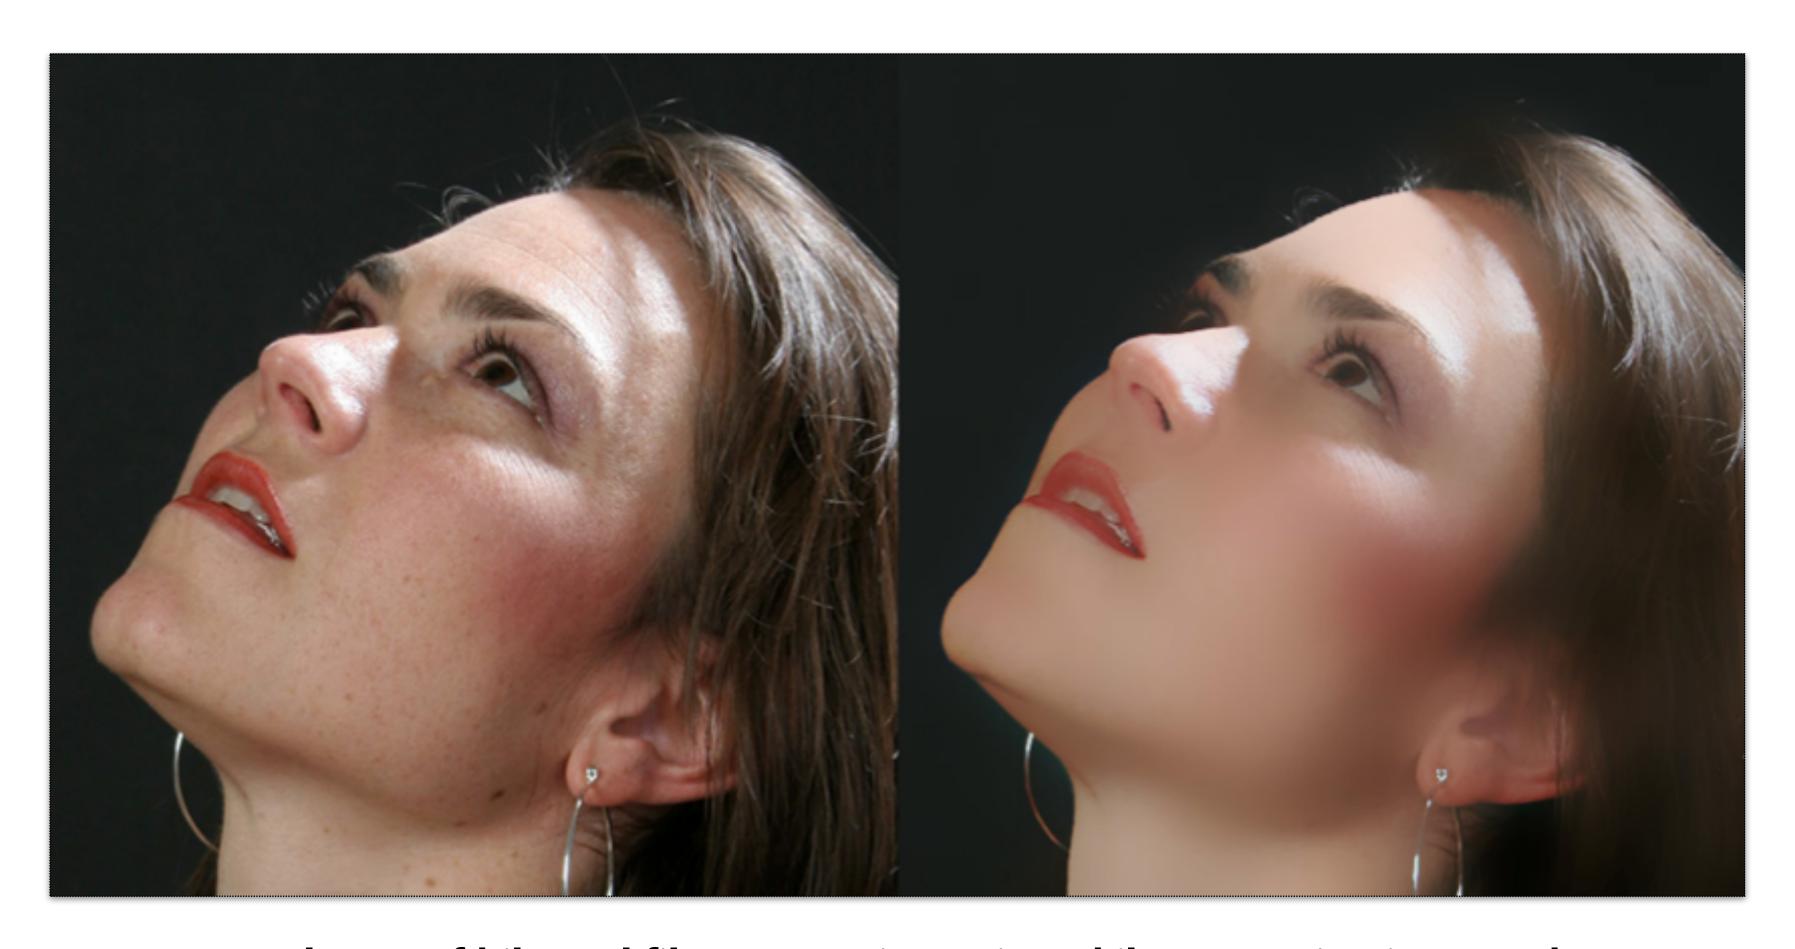

1px median filter

10px median filter

## Bilateral Filter

Example use of bilateral filter: removing noise while preserving image edges

## Intuition

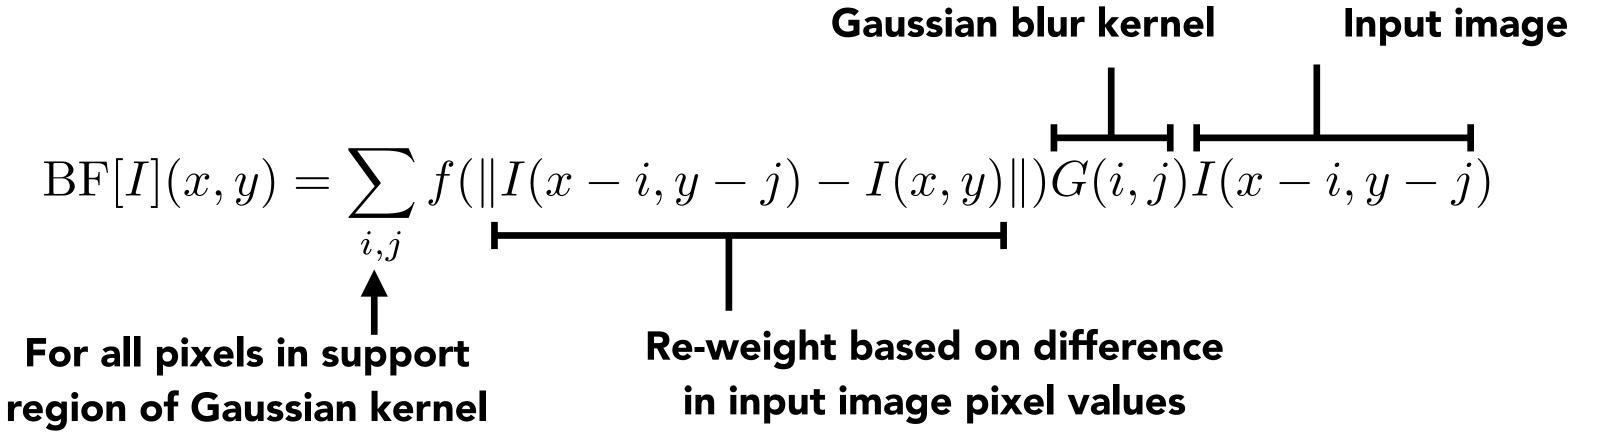

Isotropic filtering

Anisotopic, data dependent filtering

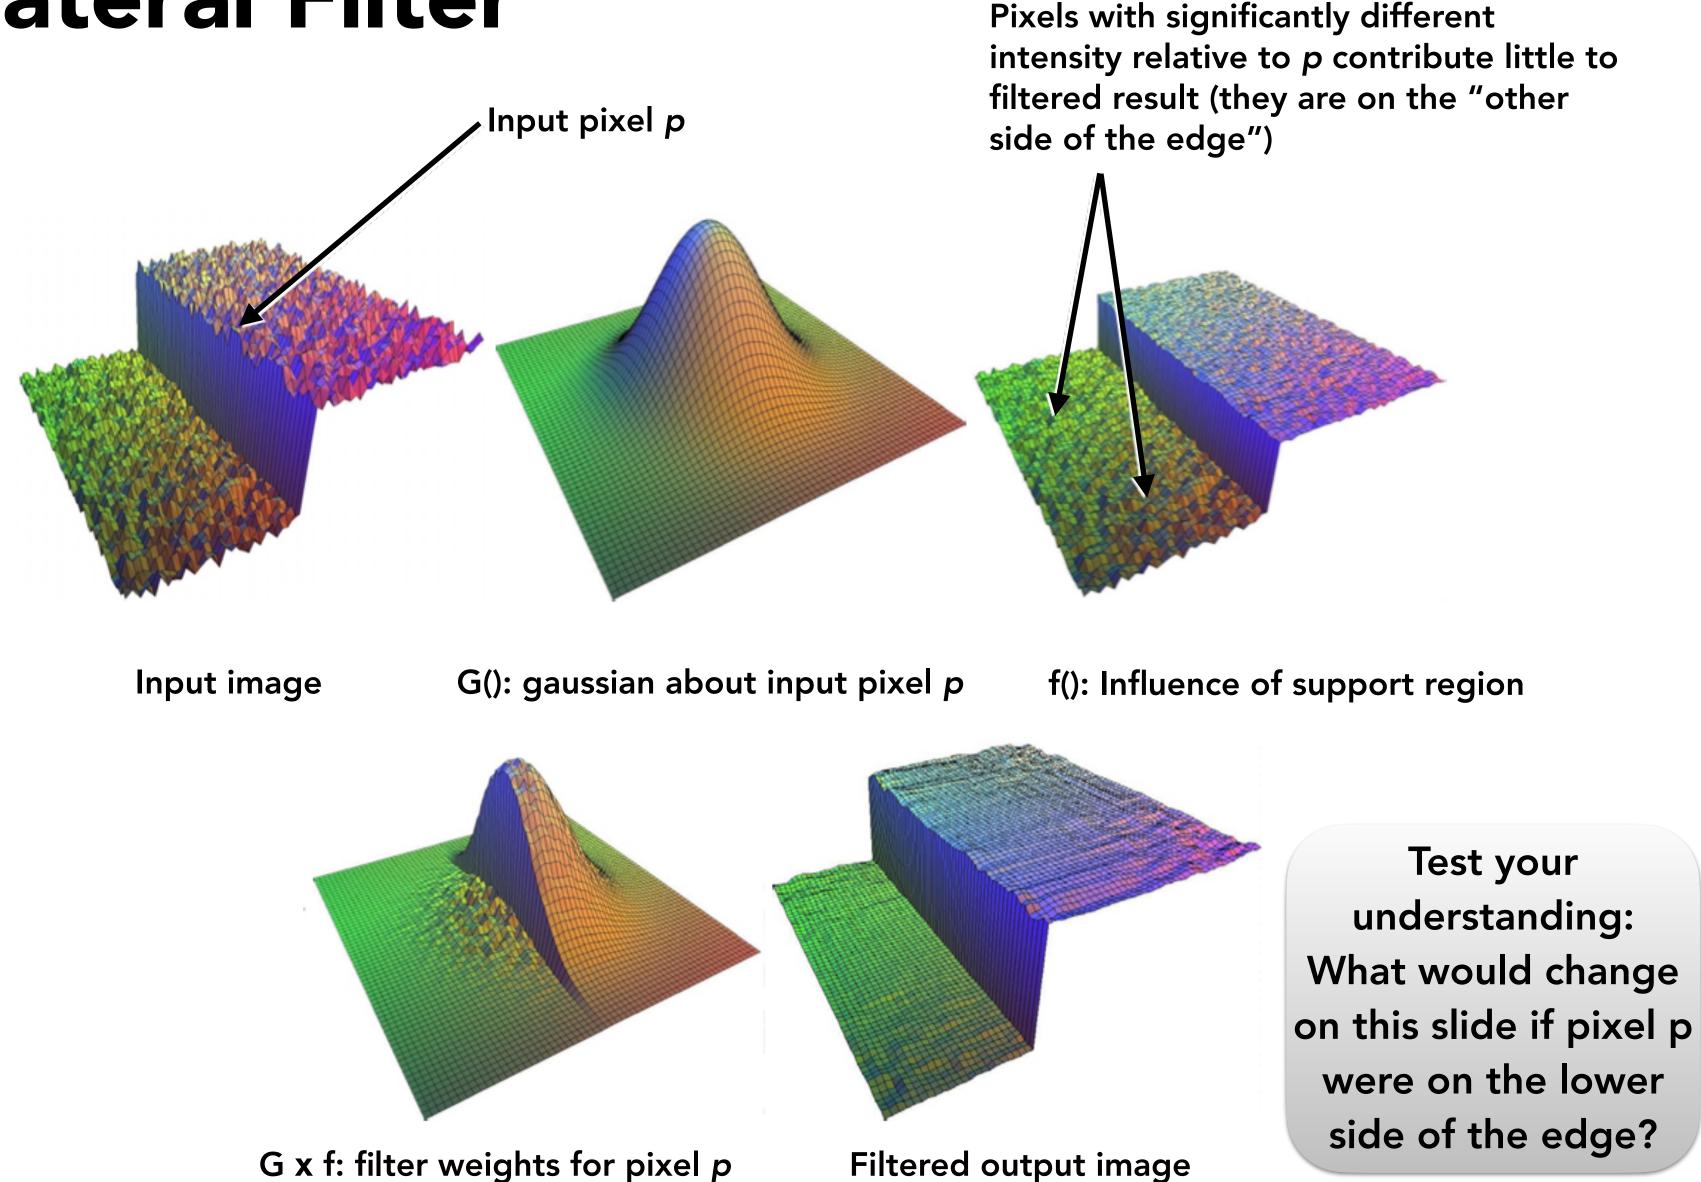

CS184/284A Ng & Kanazawa

#### **Bilateral Filter**

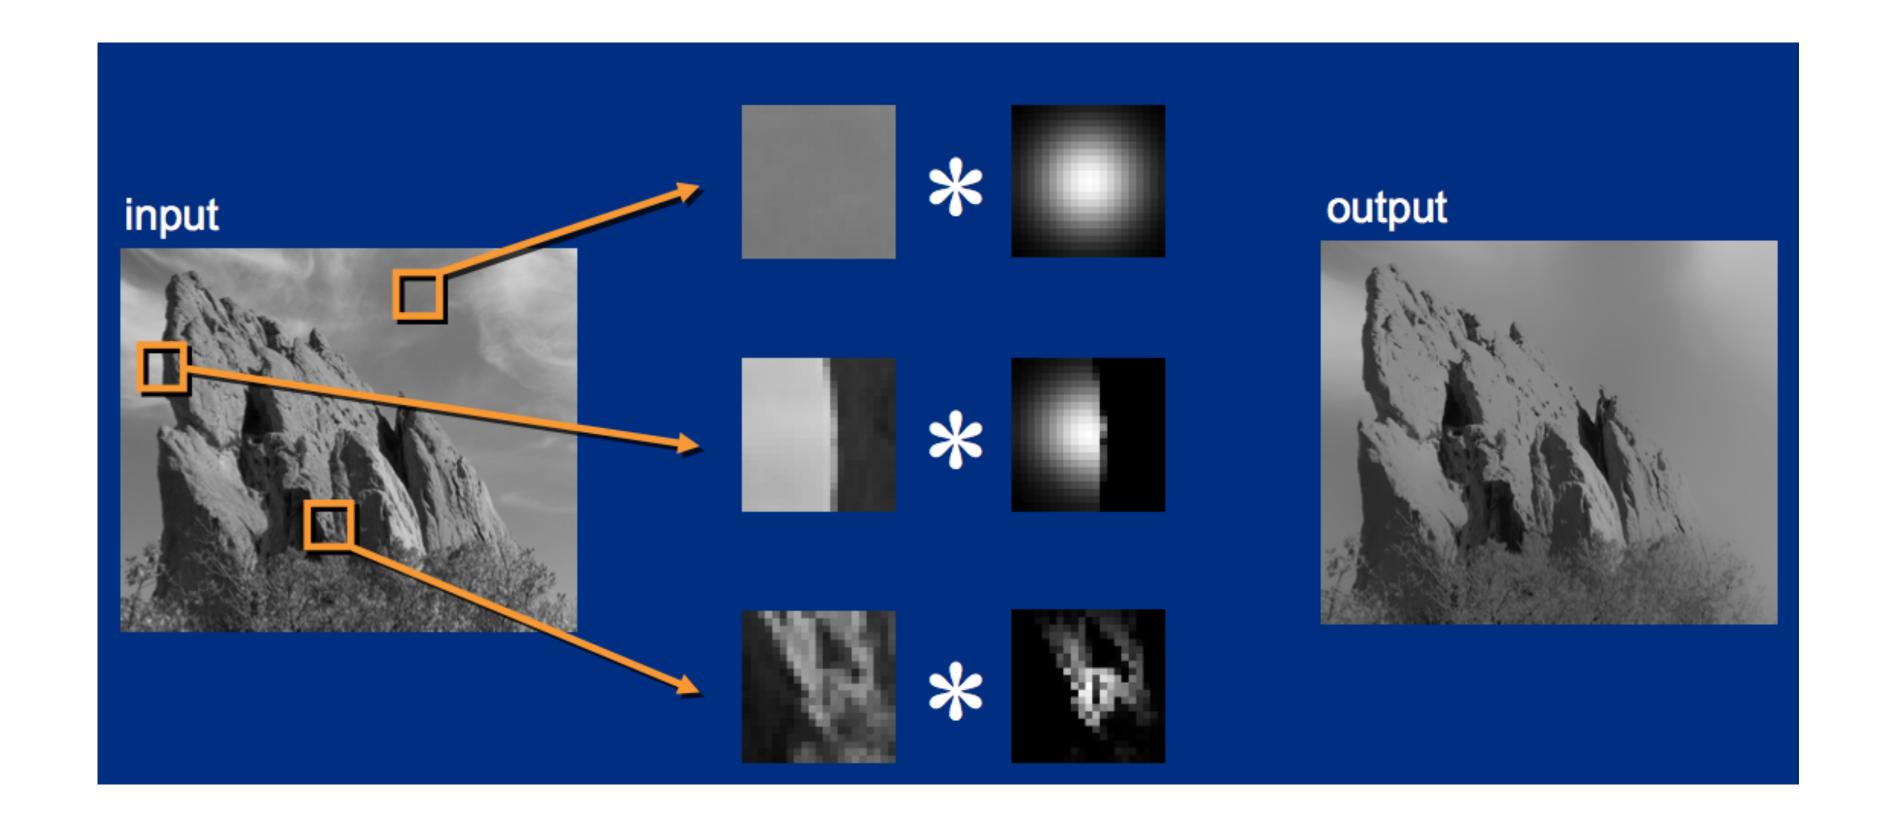

- Value of output pixel (x,y) is the weighted sum of all pixels in the support region of a truncated gaussian kernel
- But weight is combination of both spatial distance and intensity difference.
   (another non-linear, data-dependent filter)
- The bilateral filter is an "edge preserving" filter: down-weight contribution of pixels on the other side of strong edges. f(x) defines what "strong edge means"
- Spatial distance weight term f(x) could itself be a gaussian
  - Or very simple: f(x) = 0 if x > threshold, 1 otherwise

### **Bilateral Filter**

#### Bilateral Filter: Kernel Depends on Image Content

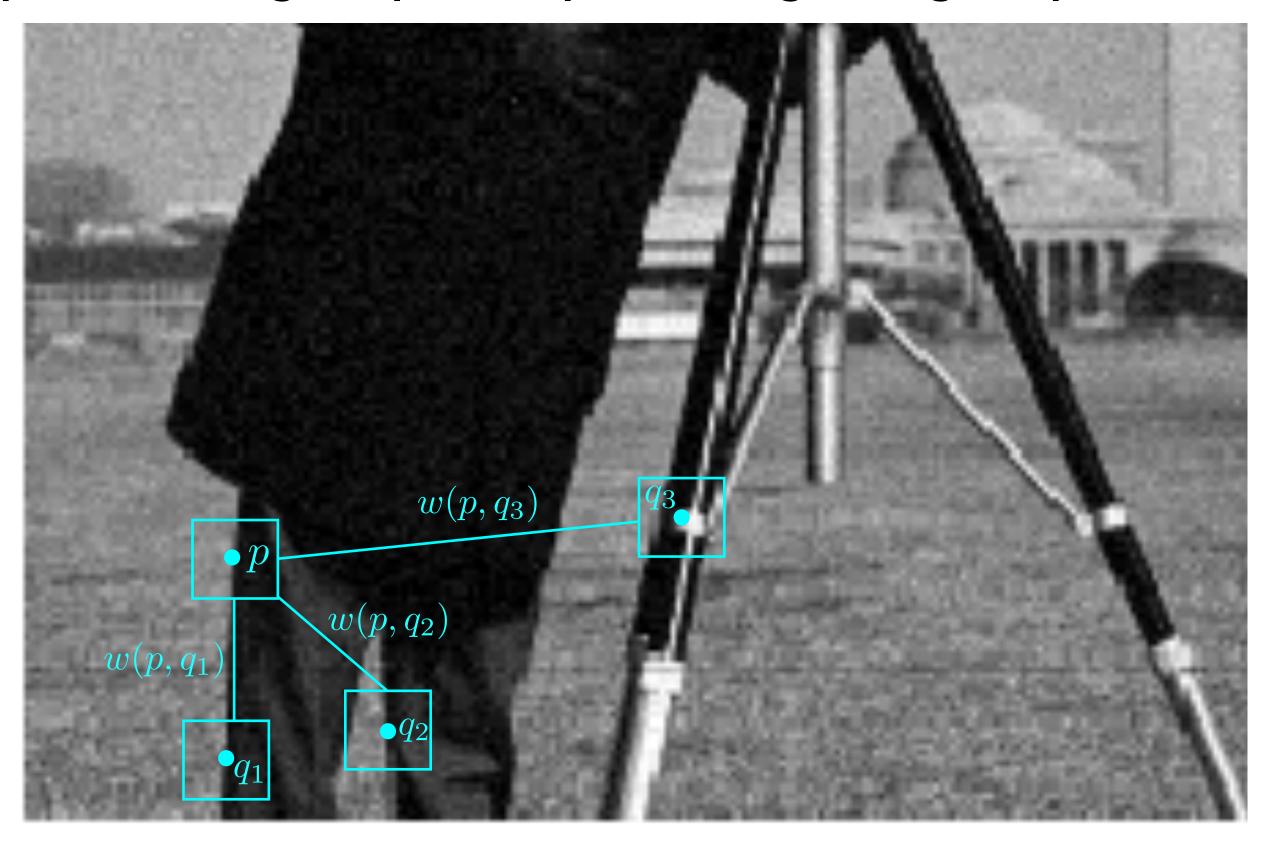

# Data-Driven Image Processing: "Image Manipulation by Example"

## Denoising with Non-Local Means

Large weight for input pixels that have similar neighborhood as p

- Intuition: filtered result is the average of pixels "like" this one
  - Most similar pixel has no reason to be nearby at all!!
- In example below-right: q1 and q2 have high weight, q3 has low weight

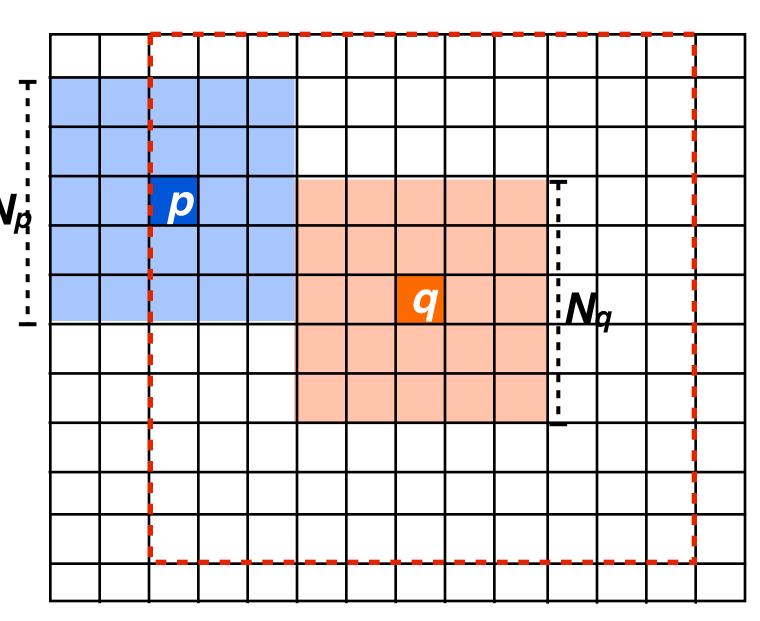

## Denoising Using Non-Local Means

Main idea: replace pixel with average value of nearby pixels that have a similar surrounding region.

Assumption: images have repeating structure

$$\mathrm{NL}[I](\mathbf{p}) = \sum_{\mathbf{q} \in \mathbf{S}(\mathbf{p})} w(\mathbf{p}, \mathbf{q}) I(q)$$
 All points in search region about p

$$w(p,q) = \frac{1}{C_p} e^{-\frac{\|N_p - N_q\|^2}{h^2}}$$

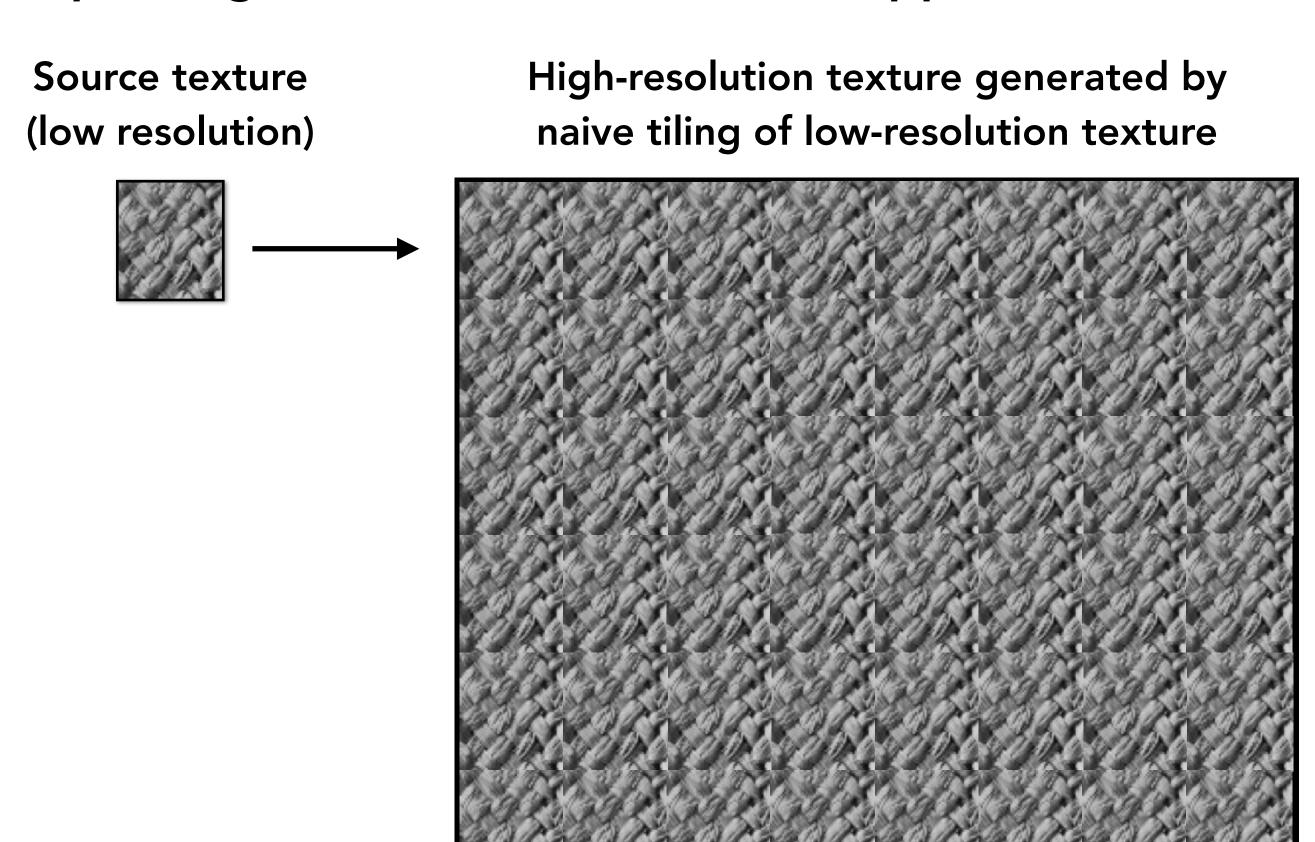

- Np and Nq are vectors of pixel values in square window around pixels p and q (highlighted regions in figure)
- L2 difference between Np and Nq = "similarity" of surrounding regions
- Cp is just a normalization constant to ensure weights sum to one for pixel p.
- S is the search region around p (given by dotted red line in figure)

## Texture Synthesis

Input: low-resolution texture image

Desired output: high-resolution texture that appears "like" the input

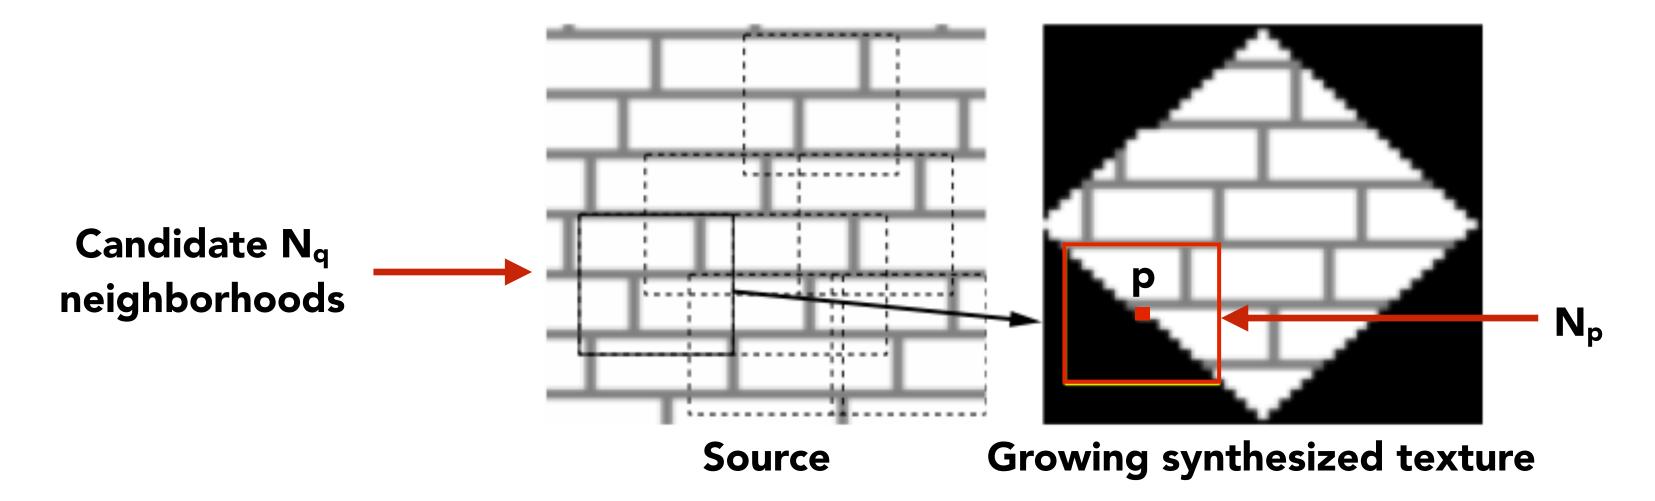

## Algorithm: Non-Parametric Texture Synthesis

Main idea: For a given pixel p, find a probability distribution function for possible values of p, based on its neighboring pixels.

Define neighborhood  $N_p$  to be the NxN pixels around p

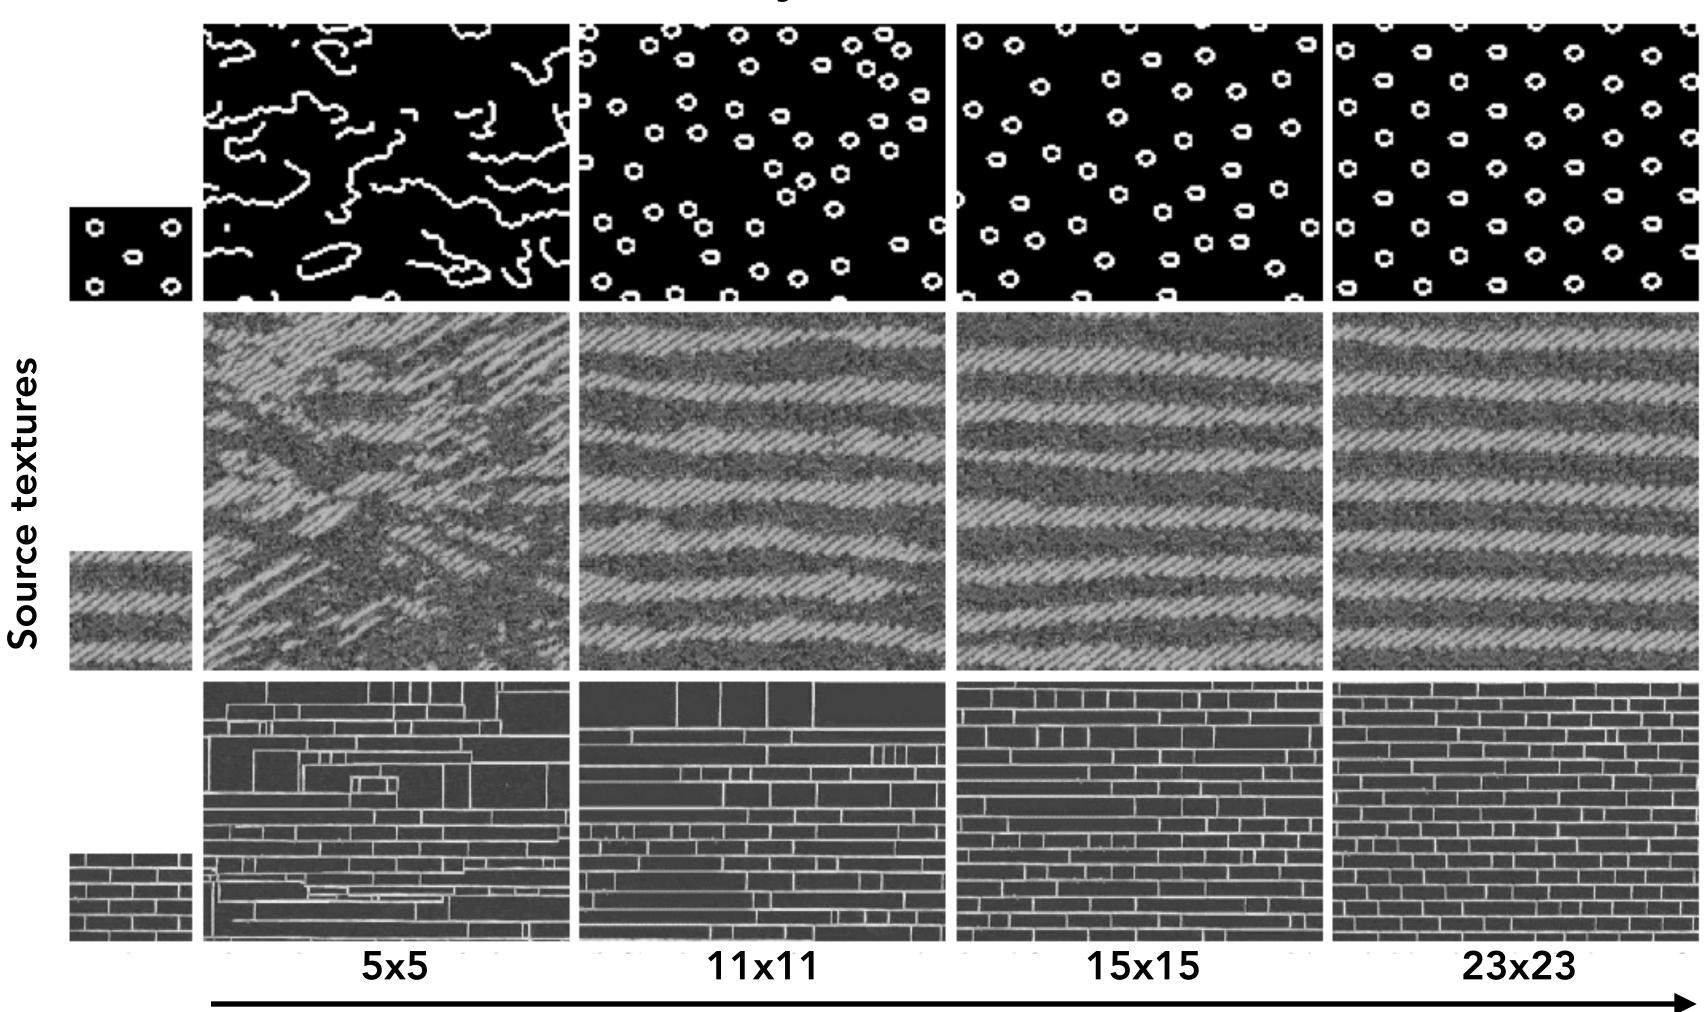

To synthesize each pixel p:

- 1. Find other  $N \times N$  patches  $(N_q)$  in the image that are most similar to  $N_p$
- 2. Center pixels of the closest patches are candidates for p
- 3. Randomly sample from candidates weighted by distance  $d(N_p, N_q)$

## Non-Parametric Texture Synthesis

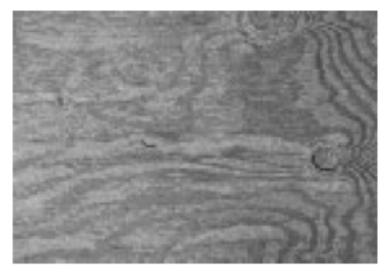

**Synthesized Textures** 

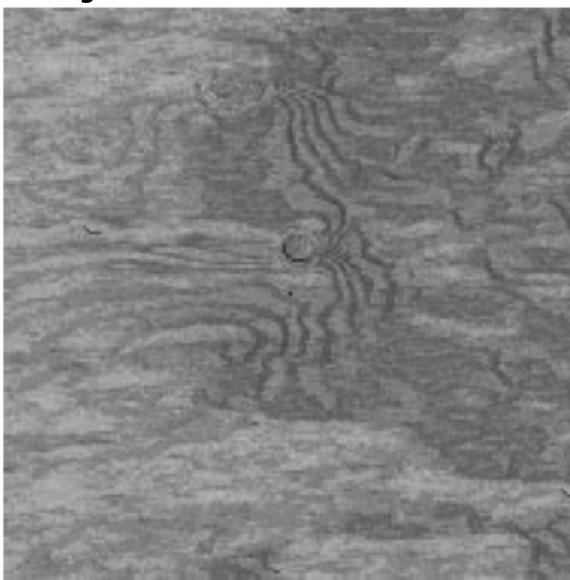

Increasing size of neighborhood search window: w(p)

## More Texture Synthesis Examples

## Image Completion Example

**Original Image** 

**Masked Region** 

**Completion Result** 

Goal: fill in masked region with "plausible" pixel values.

See PatchMatch algorithm [Barnes 2009] for a fast randomized algorithm for finding similar patches

## Things to Remember

JPEG as an example of exploiting perception in visual systems

Chroma subsampling and DCT transform

Image processing via convolution

- Different operations by changing filter kernel weights
- Fast separable filter implementation: multiple 1D filters

Data-dependent image processing techniques

Bilateral filtering, Efros-Leung texture synthesis
