Lecture 6:
The Rasterization Pipeline

Computer Graphics and Imaging
UC Berkeley CS184/284A
What We’ve Covered So Far

- Position objects and the camera in the world
- Compute position of objects relative to the camera
- Project objects onto the screen
- Sample triangle coverage
- Interpolate triangle attributes
- Sample texture maps
Rotating Cubes in Perspective

What Else Are We Missing?

Surface representations

• Objects in the real world exhibit highly complex geometric details

Lighting and materials

• Appearance is a result of how light sources reflect off complex materials

Camera models

• Real lenses create images with focusing and other optical effects
Course Roadmap

Rasterization Pipeline
  Core Concepts
  • Sampling
  • Antialiasing
  • Transforms

Intro
  Rasterization
  Transforms & Projection
  Texture Mapping
  Today: Visibility, Shading, Overall Pipeline

Geometric Modeling

Lighting & Materials

Cameras & Imaging

CS184/284A  Ren Ng
Visibility
Painter’s Algorithm

Inspired by how painters paint
Paint from back to front, overwrite in the framebuffer
Painter’s Algorithm

Requires sorting in depth (\(O(n \log n)\) for \(n\) triangles)

Can have unresolvable depth order

[Foley et al.]
Z-Buffer

This is the hidden-surface-removal algorithm that eventually won.

Idea:

• Store current min. z-value for each sample position
• Needs an additional buffer for depth values
  • framebuffer stores RBG color values
  • depth buffer (z-buffer) stores depth (16 to 32 bits)
Z-Buffer Example

Rendering

Depth buffer
Z-Buffer Algorithm

Initialize depth buffer to $\infty$

During rasterization:

for (each triangle $T$)
  for (each sample $(x,y,z)$ in $T$)
    if ($z < z\text{buffer}[x,y]$) // closest sample so far
      framebuffer[$x,y$] = rgb; // update color
      z\text{buffer}[$x,y$] = z; // update z
    else
      ; // do nothing, this sample is not closest
Z-Buffer Algorithm
Z-Buffer Complexity

Complexity

- $O(n)$ for $n$ triangles
- How can we sort $n$ triangles in linear time?

Most important visibility algorithm

- Implemented in hardware for all GPUs
- Used by OpenGL
Simple Shading
(Blinn-Phong Reflection Model)
Simple Shading vs Realistic Lighting & Materials

What we will cover today

• A local shading model: simple, per-pixel, fast
• Based on perceptual observations, not physics

What we will cover later in the course

• Physics-based lighting and material representations
• Global light transport simulation
Perceptual Observations

- Specular highlights
- Diffuse reflection
- Ambient lighting

Photo credit: Jessica Andrews, flickr
Local Shading

Compute light reflected toward camera

Inputs:
- Viewer direction, \( v \)
- Surface normal, \( n \)
- Light direction, \( l \)  
  (for each of many lights)
- Surface parameters  
  (color, shininess, ...)

\( v \)
\( l \)
\( n \)
\( v \)
Diffuse Reflection

Light is scattered uniformly in all directions

- Surface color is the same for all viewing directions

Lambert’s cosine law

Top face of cube receives a certain amount of light

Top face of 60° rotated cube intercepts half the light

In general, light per unit area is proportional to $\cos \theta = \mathbf{l} \cdot \mathbf{n}$
Light Falloff

intensity here: $I$

intensity here: $I / r^2$

$r$
Lambertian (Diffuse) Shading

Shading independent of view direction

\[ L_d = k_d \left( \frac{I}{r^2} \right) \max(0, n \cdot l) \]
Lambertian (Diffuse) Shading

Produces matte appearance

$k_d$
Perceptual Observations

Specular highlights

Diffuse reflection

Ambient lighting

Photo credit: Jessica Andrews, flickr
Specular Shading (Blinn-Phong)

Intensity depends on view direction

- Bright near mirror reflection direction
Specular Shading (Blinn-Phong)

Close to mirror direction $\Leftrightarrow$ half vector near normal

- Measure "near" by dot product of unit vectors

\[
\begin{align*}
    h &= \text{bisector}(v, l) \\
    &= \frac{v + l}{\|v + l\|} \\
    L_s &= k_s \left( \frac{I}{r^2} \right) \max(0, \cos \alpha)^p \\
    &= k_s \left( \frac{I}{r^2} \right) \max(0, n \cdot h)^p
\end{align*}
\]
Cosine Power Plots

Increasing $p$ narrows the reflection lobe

[Graphs showing cosine power plots for $\cos \alpha$, $\cos^2 \alpha$, $\cos^4 \alpha$, and $\cos^6 \alpha$]
Specular Shading (Blinn-Phong)

\[ L_s = k_s \left( \frac{I}{r^2} \right) \max(0, n \cdot h)^p \]
Perceptual Observations

Specular highlights

Diffuse reflection

Ambient lighting

Photo credit: Jessica Andrews, flickr
Ambient Shading

Shading that does not depend on anything

- Add constant color to account for disregarded illumination and fill in black shadows

\[ L_a = k_a I_a \]

- \( L_a \) represents the reflected ambient light
- \( k_a \) is the ambient coefficient
- \( I_a \) is the ambient illumination
Blinn-Phong Reflection Model

\[ L = L_a + L_d + L_s \]

\[ = k_a I_a + k_d \left( \frac{I}{r^2} \right) \max(0, \mathbf{n} \cdot \mathbf{l}) + k_s \left( \frac{I}{r^2} \right) \max(0, \mathbf{n} \cdot \mathbf{h})^p \]
Blinn-Phong Reflection Model

\[ L = L_a + L_d + L_s \]
\[ = k_a I_a + k_d \left( \frac{I}{r^2} \right) \max(0, n \cdot l) + k_s \left( \frac{I}{r^2} \right) \max(0, n \cdot h)^p \]
Shading Triangle Meshes
Shading Frequency: Triangle, Vertex or Pixel

Shade each triangle (flat shading)
- Triangle face is flat — one normal vector
- Not good for smooth surfaces

Shade each vertex ("Gouraud" shading)
- Interpolate colors from vertices across triangle
- Each vertex has a normal vector

Shade each pixel ("Phong" shading)
- Interpolate normal vectors across each triangle
- Compute full shading model at each pixel
Shading Frequency: Face, Vertex or Pixel

- Shading freq.: Face, Vertex, Pixel
- Shading type: Flat, Gouraud, Phong (*)

Num Vertices

Defining Per-Vertex Normal Vectors

Best to get vertex normals from the underlying geometry

• e.g. consider a sphere

Otherwise have to infer vertex normals from triangle faces

• Simple scheme: average surrounding face normals

\[ N_v = \frac{\sum_i N_i}{\| \sum_i N_i \|} \]
Defining Per-Pixel Normal Vectors

Barycentric interpolation of vertex normals

Problem: length of vectors?
Rasterization Pipeline
Rasterization Pipeline

Input: vertices in 3D space
Vertices positioned in screen space
Triangles positioned in screen space
Fragments (one per covered sample)
Shaded fragments
Output: image (pixels)
Rasterization Pipeline

- **Application**
  - **Vertex Processing**
    - Vertex Stream
  - **Triangle Processing**
    - Triangle Stream
  - **Rasterization**
  - **Fragment Processing**

Z-Buffer Visibility Tests
Shader Programs

• Program vertex and fragment processing stages
• Describe operation on a single vertex (or fragment)

Example GLSL fragment shader program

uniform sampler2D myTexture;
uniform vec3 lightDir;
varying vec2 uv;
varying vec3 norm;

void diffuseShader()
{
    vec3 kd;
    kd = texture2d(myTexture, uv);
    kd *= clamp(dot(-lightDir, norm), 0.0, 1.0);
    gl_FragColor = vec4(kd, 1.0);
}

• Shader function executes once per fragment.
• Outputs color of surface at the current fragment’s screen sample position.
• This shader performs a texture lookup to obtain the surface’s material color at this point, then performs a diffuse lighting calculation.
Shader Programs

- Program vertex and fragment processing stages
- Describe operation on a single vertex (or fragment)

Example GLSL fragment shader program

```glsl
uniform sampler2D myTexture; // program parameter
uniform vec3 lightDir; // program parameter
varying vec2 uv; // per fragment value (interp. by rasterizer)
varying vec3 norm; // per fragment value (interp. by rasterizer)

void diffuseShader()
{
    vec3 kd;
    kd = texture2d(myTexture, uv); // material color from texture
    kd *= clamp(dot(-lightDir, norm), 0.0, 1.0); // Lambertian shading model
    gl_FragColor = vec4(kd, 1.0); // output fragment color
}
```
Goal: Highly Complex 3D Scenes in Realtime

- 100’s of thousands to millions of triangles in a scene
- Complex vertex and fragment shader computations
- High resolution (3-5+ megapixel + supersampling)
- 30-60 frames per second (even higher for VR)
Graphics Pipeline Implementation: GPUs

Specialized processors for executing graphics pipeline computations

Discrete GPU Card
(NVIDIA GeForce Titan X)

Integrated GPU:
(Part of Intel CPU die)
CPU vs GPU

https://www.youtube.com/watch?v=ZrJeYFxpUyQ
CPU vs GPU

https://www.youtube.com/watch?v=ZrJeYFxpUyQ
Modern GPUs offer ~2-4 Tera-FLOPs of performance for executing vertex and fragment shader programs.

Tera-Op’s of fixed-function compute capability over here.
Shading from Today is Phenomenological (Hack)
Things to Remember

Visibility

- Painter’s algorithm and Z-Buffer algorithm

Simple Shading Model

- Key geometry: lighting, viewing & normal vectors
- Ambient, diffuse & specular reflection functions
- Shading frequency: triangle, vertex or fragment

Graphics Rasterization Pipeline

- Where do transforms, rasterization, shading, texturing and visibility computations occur?
- GPU = parallel processor implementing graphics pipeline
