## Lecture 5:

## Texture Mapping

Computer Graphics and Imaging UC Berkeley CS184/284A

## Texture Mapping Has Many Uses

## Describe Surface Material Properties

## Describe Surface Material Properties

- Add details without raising geometric complexity
- Paste image onto geometry or define procedurally

## Texture Coordinate Mappings

## Think Chocolate Wrappers

Texture image

## Three Spaces

Surface lives in 3D world space
Every 3D surface point also has a place where it goes in the 2D image and in the 2D texture.

Screen space

World space

Texture space

## Image Texture Applied to Surface

Rendering without texture

Rendering with texture

Texture image

Each triangle "copies" a piece of the texture image back to the surface.

## Visualization of Texture Coordinates

Each surface point is assigned a texture coordinate ( $u, v$ )

## Image Texture Applied to Surface

Each surface point is assigned a texture coordinate ( $u, v$ )

CS184/284A

## Sponza Palace Model

Textures applied to surfaces

## Sponza Palace Model

Visualization of texture coordinates

## Sponza Palace Model

Example textures used

# Interpolation Across Triangles: Barycentric Coordinates 

## Interpolation Across Triangles

Why do we want to interpolate?

- Specify values (e.g. texture coordinates) at vertices, and obtain smoothly varying values across surface
What do we want to interpolate?
- Texture coordinates, colors, normal vectors, ...

How do we interpolate?

- Barycentric coordinates

## Barycentric Coordinates

A coordinate system for triangles $(\alpha, \beta, \gamma)$

## Barycentric Coordinates - Examples

## Barycentric Coordinates - Examples

## Linear Interpolation Across Triangle

## Barycentric coords linearly interpolate values at vertices

## Barycentric Coordinates

Geometric viewpoint - proportional distances

## Computing Barycentric Coordinates

Recall the line equation we derived in Lecture 2. $\mathrm{L}_{\mathrm{PQ}}(\mathrm{x}, \mathrm{y})$ is proportional to the distance from line $P Q$.

$$
L_{P Q}(x, y)=-\left(x-x_{P}\right)\left(y_{Q}-y_{P}\right)+\left(y-y_{P}\right)\left(x_{Q}-x_{P}\right)
$$

## Computing Barycentric Coordinates

Geometric viewpoint - proportional distances

$$
\alpha=\frac{L_{B C}(x, y)}{L_{B C}\left(x_{A}, y_{A}\right)}
$$

Similar construction for other coordinates

## Barycentric Coordinate Formulas

$$
\begin{aligned}
& \alpha=\frac{-\left(x-x_{B}\right)\left(y_{C}-y_{B}\right)+\left(y-y_{B}\right)\left(x_{C}-x_{B}\right)}{-\left(x_{A}-x_{B}\right)\left(y_{C}-y_{B}\right)+\left(y_{A}-y_{B}\right)\left(x_{C}-x_{B}\right)} \\
& \beta=\frac{-\left(x-x_{C}\right)\left(y_{A}-y_{C}\right)+\left(y-y_{C}\right)\left(x_{A}-x_{C}\right)}{-\left(x_{B}-x_{C}\right)\left(y_{A}-y_{C}\right)+\left(y_{B}-y_{C}\right)\left(x_{A}-x_{C}\right)} \\
& \gamma=1-\alpha-\beta
\end{aligned}
$$

## Barycentric Coordinates

Alternative geometric viewpoint - proportional areas

$$
\begin{aligned}
\alpha & =\frac{A_{A}}{A_{A}+A_{B}+A_{C}} \\
\beta & =\frac{A_{B}}{A_{A}+A_{B}+A_{C}} \\
\gamma & =\frac{A_{C}}{A_{A}+A_{B}+A_{C}}
\end{aligned}
$$

## Perspective Projection and Interpolation

## Perspective Projection and Interpolation

Texture

Plane tilted down with perspective projection -
What's wrong?

## Perspective Projection and Interpolation

Texture

Barycentric interpolation of
texture
coordinates in
screen-space

## Perspective Projection Creates Non Linearity

Linear interpolation in world coordinates yields nonlinear interpolation in screen coordinates!

Perspective interpolation supported in GPU

## Perspective-Correct Interpolation

Affine
screen-space interpolation

Perspective world-space interpolation

Applying Textures is Sampling!

## Simple Texture Mapping Operation

for each rasterized screen sample ( $x, y$ ):
$(u, v)=$ evaluate texcoord value at ( $x, y$ )
float3 texcolor = texture.sample(u,v); set sample's color to texcolor;

## Applying Textures is Sampling!

Actually "re-sampling"
Mathematically, to draw a texture sample at ( $u, v$ ):

- Start with discrete, sampled 2D function $f(x, y)$. This function is only non-zero at sampled locations
- Reconstruct a continuous 2D function, $f_{\text {cont }}(x, y)=f(x, y)$ * $k(x, y)$ by convolution with a reconstruction filter $k(x, y)$
- Draw the desired sample at ( $u, v$ ) from the continuous 2D signal by function evaluation: $f_{\text {cont }}(u, v)$
Signal processing concepts that should come to mind for you:
- Frequency spectrum, aliasing, Nyquist frequency, filtering, anti-aliasing...

## Point Sampling Textures

High-res reference
Source image: 1280×1280 pixels

Point sampling
256x256 pixels

## Texture Sampling Frequency

## Sampling Rate on Screen vs Texture

1:1 mapping

## Sampling Rate on Screen vs Texture

Screen space ( $x, y$ )

Texture space ( $u, v$ )

Magnified

## Sampling Rate on Screen vs Texture

## Texture Sampling Rate

The sampling frequency in screen space translates to a sampling frequency in texture space as determined by the mapping function.
In general the frequency varies across the scene depending on geometric transforms, viewing transforms, and the texture coordinate function.

## Screen Pixel Area vs Texel Area

At optimal viewing size:

- 1:1 mapping between pixel sampling rate and texel sampling rate
- Dependent on texture resolution! e.g. 512x512

When larger (magnification)

- Multiple pixel samples per texel sample

When smaller (minification)

- One pixel sample per multiple texel samples

## Screen Pixel Footprint in Texture

| $\bullet$ | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\bullet$ | - | - | - | - | - | - | - | - | - | - | - |  |  | $\bullet$ | - |
| $\bullet$ | - | - | - | - |  | $\bullet$ |  |  |  |  |  |  | - |  | 7 |
| - | $\triangle \square$ |  | $7$ | $\bullet$ | $1$ | $9$ |  |  |  |  |  |  | $\bullet$ |  |  |
| - | - | - |  |  |  | . |  |  |  |  | $1$ |  | - | , | - |
| - | - | - | - | - | - | $\bullet$ | - | - |  | - |  |  |  |  | $\bullet$ |
| - | $\bullet$ | - | - | - | $\bullet$ | $\bullet$ | $\bullet$ | $\bullet$ | - | - | $\bullet$ | - | - | - | $\bullet$ |
| - | - | - | - | - | $\bullet$ | $\bullet$ | - | $\bullet$ | - | $\bullet$ | - | $\bullet$ | $\bullet$ | $\bullet$ | - |

Upsampling (Magnification)

Downsampling (Minification)

## Screen Pixel Footprint in Texture

Screen space
Texture space
NB: texture sampling pattern not rectilinear or isotropic

## Estimating Footprint Area With Jacobian

Screen space

Texture space

## Texture Antialiasing

## Will Supersampling Antialias?

High-res reference

512x supersampling

## Texture Antialiasing

Will supersampling work?

- Yes, high quality, but costly
- When highly minified, many texels in pixel footprint

Goal: efficient texture antialiasing

- Want antialiasing with one/few texels per pixel
- How? Antialiasing = filtering before sampling!

## Antialiasing: Signal, Sampling Rate, Nyquist Rate?

Screen space
Texture space
What signal are we sampling? What is the sampling frequency? What is the Nyquist frequency?

Texture Filtering

Texture Magnification

## Texture Magnification - Easy Case

(Generally don't want this - insufficient resolution)
This is image interpolation (will see kernel function)

Nearest

Bilinear

Bicubic

## Bilinear Filtering

# Want to sample texture value $f(u, v)$ at red point 

Black points indicate texture sample locations

## Bilinear Filtering

# Take 4 nearest sample locations, with texture values as labeled. 

## Bilinear Filtering

# And fractional offsets, ( $\mathbf{s}, \mathrm{t}$ ) as shown 

## Bilinear Filtering

Linear interpolation (1D)

$$
\operatorname{lerp}\left(x, v_{0}, v_{1}\right)=v_{0}+x\left(v_{1}-v_{0}\right)
$$

## Bilinear Filtering

Linear interpolation (1D)

$$
\operatorname{lerp}\left(x, v_{0}, v_{1}\right)=v_{0}+x\left(v_{1}-v_{0}\right)
$$

Two helper lerps (horizontal)

$$
\begin{aligned}
& u_{0}=\operatorname{lerp}\left(s, u_{00}, u_{10}\right) \\
& u_{1}=\operatorname{lerp}\left(s, u_{01}, u_{11}\right)
\end{aligned}
$$

## Bilinear Filtering

Linear interpolation (1D)

$$
\operatorname{lerp}\left(x, v_{0}, v_{1}\right)=v_{0}+x\left(v_{1}-v_{0}\right)
$$

Two helper lerps

$$
\begin{aligned}
& u_{0}=\operatorname{lerp}\left(s, u_{00}, u_{10}\right) \\
& u_{1}=\operatorname{lerp}\left(s, u_{01}, u_{11}\right)
\end{aligned}
$$

Final vertical lerp, to get result:
$f(x, y)=\operatorname{lerp}\left(t, u_{0}, u_{1}\right)$

## Reconstruction Filter Function

Test your understanding:

- What is the reconstruction filter $k(x, y)$ for bilinear interpolation? Nearest? What is a theoretically ideal filter? What are the pros/cons of each?

Nearest

Bilinear

Bicubic

## Texture Minification

## Texture Minification - Hard Case

Challenging

- Many texels can contribute to pixel footprint
- Shape of pixel footprint can be complex

Idea:

- Take texture image file, then low-pass filter it (i.e. filter out high frequencies) and downsample it (i.e. sample at a lower resolution) texture file. Do this recursively, and store successively lower resolution, each with successively lower maximum signal frequency.
- For each sample, use the texture file whose resolution approximates the screen sampling rate

## Level 0 - Full Resolution Texture

## Level 2 - Downsample 4x4

## Level 4 - Downsample 16x16

## Mipmap (L. Williams 83)

Level $0=128 \times 128$

Level 4 = 8x8

Level 1 = $\mathbf{6 4 \times 6 4}$

Level $5=\mathbf{4 x 4}$

Level 2 = $\mathbf{3 2 \times 3 2}$

Level $6=\mathbf{2 x} \mathbf{2}$

Level $3=16 \times 16$

Level 7 = 1x $\mathbf{1}$
"Mip" comes from the Latin "multum in parvo", meaning a multitude in a small space

## Mipmap (L. Williams 83)

Williams' original proposed mipmap layout

"Mip hierarchy" level = D

What is the storage overhead of a mipmap?

## Computing Mipmap Level D

Screen space ( $x, y$ )

Texture space ( $u, v$ )

Estimate texture footprint using texture coordinates of neighboring screen samples

## Computing Mipmap Level D

$$
\begin{gathered}
D=\log _{2} L \\
L=\max \left(\sqrt{\left(\frac{d u}{d x}\right)^{2}+\left(\frac{d v}{d x}\right)^{2}}, \sqrt{\left(\frac{d u}{d y}\right)^{2}+\left(\frac{d v}{d y}\right)^{2}}\right)
\end{gathered}
$$

## Computing Mipmap Level D

$$
\begin{gathered}
D=\log _{2} L \\
L=\max \left(\sqrt{\left(\frac{d u}{d x}\right)^{2}+\left(\frac{d v}{d x}\right)^{2}}, \sqrt{\left(\frac{d u}{d y}\right)^{2}+\left(\frac{d v}{d y}\right)^{2}}\right)
\end{gathered}
$$

## Visualization of Mipmap Level

D rounded to nearest integer level

## Trilinear Filtering

Linear interpolation based on continuous $D$ value

## Visualization of Mipmap Level

Trilinear filtering: visualization of continuous D

## Bilinear vs Trilinear Filtering Cost

Bilinear resampling:

- 4 texel reads
- 3 lerps ( $3 \mathrm{mul}+6$ add)

Trilinear resampling:

- 8 texel reads
- 7 lerps ( 7 mul + 14 add)

## Texture Filtering in Assignment

Image resampling choices

- Nearest
- Bilinear interpolation

Mipmap level resampling choices

- Always level 0
- Nearest D
- Linear interpolation
$2 \times 3=6$ choices

## Mipmap Limitations

Point sampling

## Mipmap Limitations

Supersampling 512x

## Mipmap Limitations

Overblur Why?

Mipmap trilinear sampling

## Anisotropic Filtering

Elliptical weighted average (EWA) filtering

## Anisotropic Filtering

Ripmaps and summed area tables

- Can look up axis-aligned rectangular zones
- Diagonal footprints still a problem

EWA filtering

- Use multiple lookups
- Weighted average
- Mipmap hierarchy still helps

## Advanced Texturing Methods

## Many, Many Uses for Texturing

In modern GPUs, texture = memory + filtering

- General method to bring data to fragment calculations

Many applications

- Environment lighting
- Store microgeometry
- Procedural textures
- Solid modeling
- Volume rendering

## Environment Map

A function from the sphere to colors, stored as a texture.

Lat / long texture map

Reflection vector indexes into texture map

## Spherical Environment Map

Light Probes, Paul Debevec

## Environmental Lighting

Environment map (left) used to render realistic lighting

## Cube Map

A vector maps to cube point along that direction. The cube is textured with 6 square texture maps.

## Displacement Mapping

Texture stores perturbation to surface position

## Bump Mapping

Texture stores perturbation to surface normal

## Bump Mapping

## What is missing?

Geometry

Bump mapping
Perturbs normals

Displacement mapping Perturbs positions

3D Procedural Noise + Solid Modeling

CS184/284A

## Provide Precomputed Shading

Simple shading

Ambient occlusion texture map

ysəpołn*
With ambient occlusion

## 3D Textures and Volume Rendering

## Things to Remember

Many uses of texturing

- Bring high-resolution data to fragment calculations
- Colors, normals, lighting on sphere, volumetric data, ...

How does texturing work?

- Texture coordinate parameterization
- Barycentric interpolation of coordinates
- Texture sampling pattern and frequency
- Mipmaps: texture filtering hierarchy, level calculation, trilinear interpolation
- Anisotropic sampling

## Acknowledgments
